Szanowni Państwo!

Oddajemy w Państwa ręce kolejną już edycję katalogu zestawów naprawczych **CX®**, tym razem znacznie poszerzoną w stosunku do poprzednich wersji. Nasza oferta katalogowa będąca odpowiedzią na dynamicznie zmieniającą się ofertę producentów samochodów liczy już niemal 1000 referencji. W najnowszej edycji katalogu znajdziecie Państwo szczegółowe informacje o naszych aktualnych produktach motoryzacyjnych. Zmiany w najnowszym katalogu nie dotyczą jednak tylko części tabelarycznej, znacznie poszerzyliśmy także rozdziały teoretyczne m.in. przedstawiamy szczegółową instrukcję montażu i demontażu zestawów naprawczych. Kolejną nowością to trzyjęzyczna wersja katalogu, co jest konsekwencją stałego wzrostu sprzedaży naszych produktów na rynkach zagranicznych.

Konstrukcja podstawowego elementu jezdnego samochodu, jakim jest koło, na przestrzeni ostatnich lat uległa wielu istotnym modyfikacjom. Sercem każdego koła samochodu od początku istnienia do dziś jest łożysko toczne lub zespół współpracujących łożysk tocznych. Koła jezdne poddawane są złożonym obciążeniom promieniowym oraz osiowym wynikającym zarówno z ruchu pojazdu, jak i jego masy. Wszystko to sprawia, że dobór właściwego łożyskowania staje się kluczowym elementem dla prawidłowego i bezpiecznego funkcjonowania układu jezdnego pojazdu. Wysokie oczekiwania klientów przy olbrzymiej konkurencji w branży motoryzacyjnej, skutkują powstawaniem nowych i doskonalszych rozwiązań technicznych. Zmiany konstrukcyjne z jednej strony wpływają na uzyskanie większych osiągnięć, z drugiej zaś na obniżenie kosztów produkcji i późniejszej eksploatacji.

Dla Państwa wygody katalog został podzielony na następujące części:

Informacje teoretyczne: informacje na temat łożysk stosowanych w zestawach naprawczych oraz piastach wszystkich generacji. W części tej przedstawiamy politykę jakości producenta oraz techniki i sprzęt pomiarowy stosowany do kontroli jakości łożysk **CX®**. Dodatkowo rozdział zawiera szczegółowy opis najczęstszych uszkodzeń łożysk tocznych oraz zasady montażu i demontażu zestawów naprawczych.

I. Tabele doboru zestawów - służą do prawidłowego wyboru zestawu naprawczego.

Część ta zawiera informacje dotyczące:

- marki auta,
- rodzaju i pojemności silnika, KM i KW,
- roku produkcji,
- dodatkowych szczegółów np. numeru nadwozia, rodzaju hamulców, itd.,
- zastosowania zestawu: przód, tył auta,
- numeru katalogowego zestawu, który powinien być zastosowany.

II. Skład zestawów - przedstawienie komponentów wchodzących w skład zestawów **CX®**.

III. Skrócona lista zastosowań - zawiera informacje w jakich rodzajach samochodów dany zestaw znajduje zastosowanie.

IV. Porównania - zawiera tzw. crossy odpowiedników zestawów **CX®** w innych markach.

V. Kody OE - zawiera kody OE producentów poszczególnych marek samochodów dla odpowiednich indeksów **CX®**.

Mamy nadzieję, że prezentowany katalog pozwoli Państwu dobrać najwłaściwszy zestaw, a my dajemy gwarancję, że produkty **CX®** zapewnią optymalne parametry techniczno - ekonomiczne.

Katalog, który oddajemy w Państwa ręce stanowi kolejną pozycję z serii katalogów tematycznych przedstawiających części maszyn **CX®**. Aktualnie do dyspozycji klientów są katalogi: łożysk przemysłowych, łożysk rolniczych, uszczelnień technicznych oraz pasów napędowych. Katalogi poza formą książkową są również dostępne w formie multimedialnej.

INFORMACJE O PRODUKCIE I FIRMIE

1. PROGRAM PRODUKCYJNY CX® DLA MOTORYZACJI

Produkty CX® od wielu lat znajdują zastosowanie zarówno w przemyśle, rolnictwie, jak i w motoryzacji. Troszcząc się o bezpieczeństwo, komfort i niezawodność eksploatacyjną pojazdów oferujemy szereg nowoczesnych i sprawdzonych podzespołów zaopatrujących branżę motoryzacyjną.

Oferta CX® dedykowana samochodom osobowym i dostawczym obejmuje:

- bogaty asortyment ponad 1000 produktów przeznaczonych do większości marek i modeli aut,
- stałą kontrolę jakości towarów, realizowaną z wykorzystaniem najnowocześniejszych urządzeń laboratoryjnych,
- nowoczesne rozwiązania technologiczne m.in. piasty III generacji.

Koła w samochodzie już od początku swojej historii osadzone były na osiach za pomocą piast. W pierwszych samochodach, na wzór powozów

konnych koła umieszczano na łożyskach ślizgowych. Ciągły rozwój motoryzacji sprzyjał zwiększaniu prędkości maksymalnej pojazdów. Pierwotnie łożyska stawały jednak duży opór tłoczenia i w wyniku tego ulegały szybkiemu zużyciu. Chcąc temu zaradzić już pod koniec XIX wieku zaczęto stosować piasty z łożyskami tocznymi.

Obecnie, w zależności od rozwiązania konstrukcyjnego, zestawy naprawcze do piast mogą zawierać:

- łożyska stożkowe jednorzędowe lub dwurzędowe,
- łożysko kulkowe skośne dwurzędowe,
- piastę I generacji,
- piastę II generacji,
- piastę III generacji.

Rys. 1 Program produkcyjny CX® dla motoryzacji

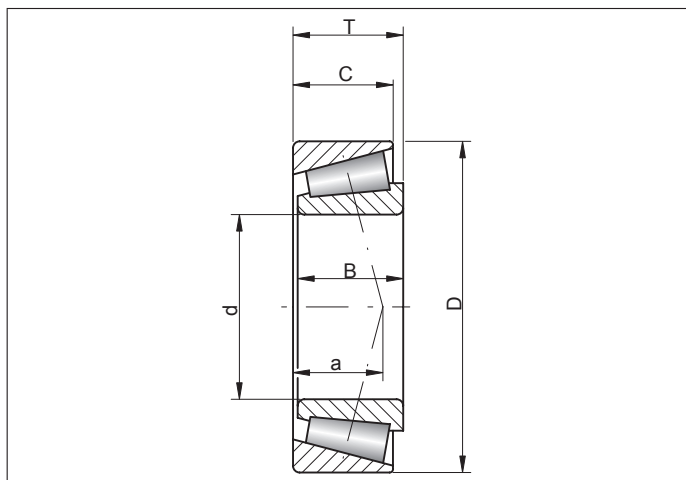

W zestawach naprawczych CX® dla wybranego modelu i rocznika samochodu znajduje się komplet łożysk lub piasty wraz z pozostałymi elementami niezbędnymi do kompletnej wymiany podzespołu tj. nakrętki, śruby, tulejki, pierścienie osadcze, uszczelnienia, czy pierścienie sprężynujące.

1.1 Łożysko stożkowe jednorzędowe i dwurzędowe

Tradycyjnym rozwiązaniem łożyskowania piasty koła jest zastosowanie dwóch łożysk stożkowych. Łożyska takie przenoszą obciążenia promieniowe i osiowe. Ze względu na to, że obciążenia osiowe przez jedno łożysko stożkowe mogą być przenoszone tylko w jednym kierunku, łożyska montowane są w piastach parami i ustawione względem siebie przeciwnie. Dużą zaletą rozwiązania z dwoma łożyskami stożkowymi jest możliwość wymiany uszkodzonego łożyska przy minimalnym nakładzie kosztów. Należy jednak zachować dużą dokładność czynności montażowych, ze względu na to, że łożyska stożkowe są bardzo wrażliwe na błędy montażu.

Rys. 2 Łożysko stożkowe jednorzędowe

Rys. 3 Łożysko stożkowe jednorzędowe

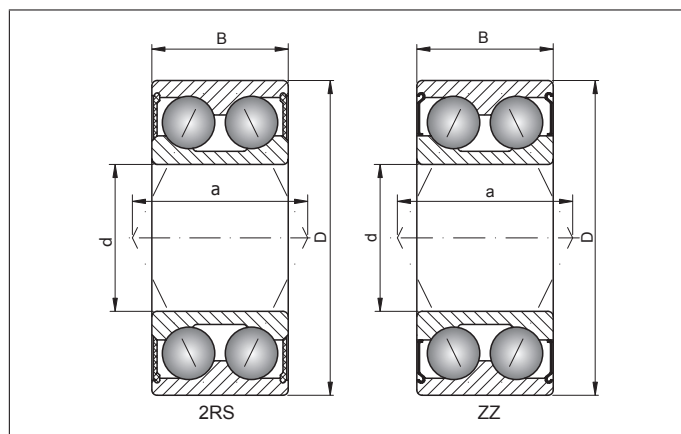

1.1.1 Budowa

Łożyska stożkowe składają się z dwóch rozłącznych elementów: pierścienia zewnętrznego, w którym znajduje się jedna ze skośnych bieżni łożyska (zewnętrzna) oraz pierścienia wewnętrznego, na którego bieżni osadzony jest koszyk z elementami tocznymi. Elementy toczne, tak zwane waleczki, są stożkami o ściętych wierzchołkach. W normalnych warunkach pracy pierścień wewnętrzny, pierścień zewnętrzny i waleczki przenoszą obciążenie, podczas gdy koszyk rozdziela i utrzymuje waleczki. Pierścień wewnętrzny z waleczkami zwany jest często podzespołem wewnętrznym.

Dwuczęściowość łożysk stożkowych ma różne zalety przy montażu i manipulowaniu łożyskiem. W łożysku stożkowym elementy toczne pracują na skośnych względem osi łożyska bieżniach, przy czym wszystkie tworzące ściętych stożków przecinają się w jednym punkcie na osi łożyska, co zapewnia prawidłowe obtaczanie waleczków na bieżniach.

1.1.2 Właściwości

Ze względu na stożkowe bieżnie łożysko stożkowe może przenieść każdą kombinację promieniowych i osiowych obciążeń. Im większy jest kąt bieżni zewnętrznej, tym większy jest stosunek nośności osiowej do nośności promieniowej. Długi styk liniowy waleczka z bieżnią umożliwia przenoszenie dużych obciążeń przez łożysko stożkowe. Łożyska stożkowe łączą cechy poprzecznych łożysk kulkowych skośnych, walcowych oraz łożysk wzdużnych. Charakterystyczną cechą łożysk stożkowych jest możliwość przenoszenia obciążeń osiowych w jednym kierunku. W związku z tym łożyska te są często montowane w parach lub w większych układach, tak jak w przypadku łożysk kulkowych skośnych jednorzędowych. Nazwy układów są analogiczne do układów łożysk skośnych (otwarty, zamknięty, tandem).

Rys. 4 Łożysko kulkowe skośne dwurzędowe

1.2 Piasta pierwszej generacji

Zespólna piasta pierwszej generacji została wyposażona we wcześniej wspomniane dwurzędowe skośne łożysko kulkowe, w którym jedna z bieżni wewnętrznych opiera się o wewnętrzny element układu napędowego, a druga dociskana jest do niej przez centralną nakrętkę piasty. Piasty pierwszej generacji często po jednej stronie posiadają uszczelniacz ze zintegrowanym magnetycznym pierścieniem ABS.

Rozwiązanie takie zajmuje mniej miejsca w kierunku osiowym, niż w przypadku zastosowania dwóch łożysk stożkowych, co ma niebagatelne znaczenie dla konstruktorów. Inną zaletą łożyskowania z wykorzystaniem łożysk kulkowych skośnych jest znacznie ułatwiony montaż. Ponadto uszczelnione łożysko zawiera wystarczający zapas smaru na cały okres eksploatacji. Jako element zamknięty jest odporny na zanieczyszczenia oraz nie wymaga korekcji luzu.

1.2.1 Budowa

Łożysko kulkowe skośne dwurzędowe pod względem budowy odpowiada parze łożysk kulkowych skośnych jednorzędowych w układzie otwartym O. Wyróżnia się następujące wykonania bieżni odpowiednio do kątów działania:

- 25° - oznaczenie **B** za symbolem łożyska
- 32° - bez oznaczenia za symbolem łożyska
- 35° - bez oznaczenia za symbolem łożyska
- 45° - oznaczenie **D** lub **DA** za symbolem łożyska (dzielony pierścień wewnętrzny).

Łożyska kulkowe skośne dwurzędowe posiadają odmiany na koscach stalowych, mosiężnych i poliamidowych, zarówno w wersjach uszczelnianych 2RS, jak i ZZ.

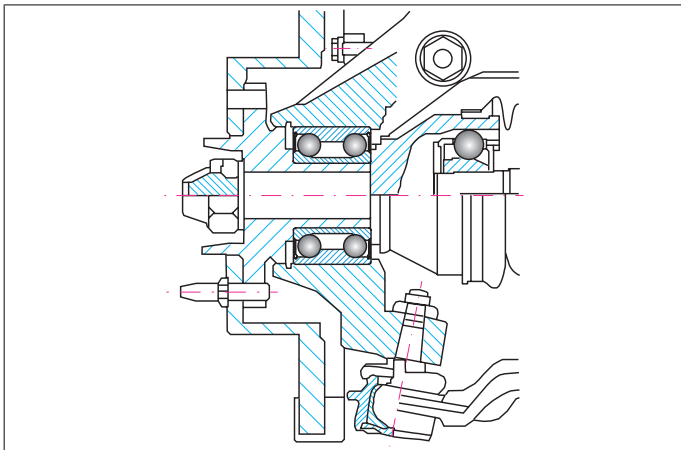

Rys. 5 Piasta pierwszej generacji

1.3 Piasta drugiej generacji

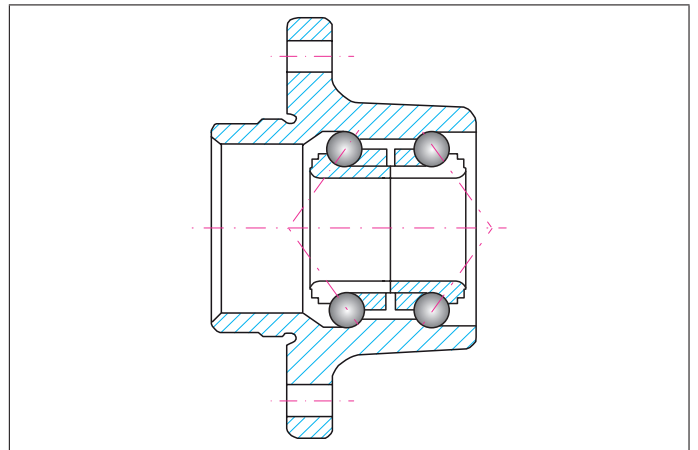

W zespolonej piaście drugiej generacji zrezygnowano z pierścienia zewnętrznego łożyska, wykonując bieżnię w materiale piasty posiadającej kołnierz. Do kołnierza zamontowano elementy wirujące układu hamulcowego oraz koło jezdne. W ten sposób ograniczono liczbę elementów, obniżono koszty produkcji, a także zmniejszono masę elementów łożyskowania.

Rys. 7 Piasta drugiej generacji

Rys. 6 Piasta pierwszej generacji

Rys. 8 Piasta drugiej generacji

1.2.2 Właściwości i zastosowanie

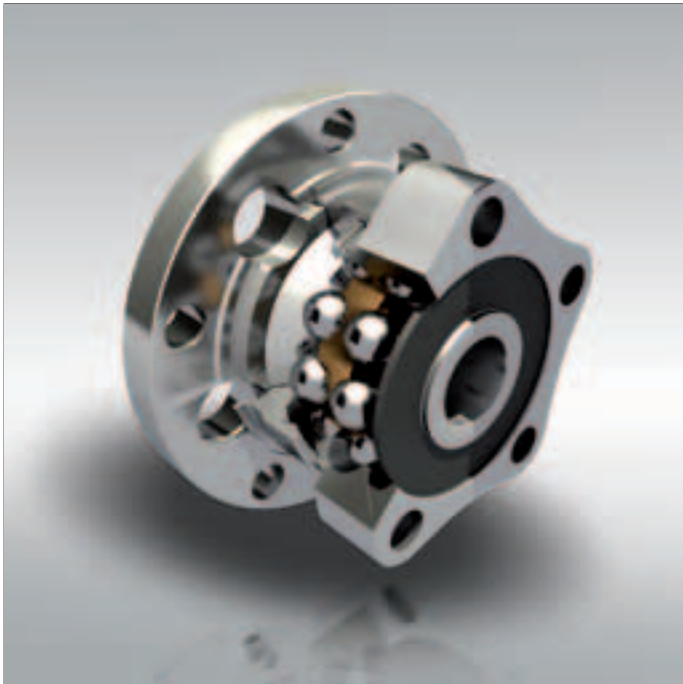

Łożysko może przejmować duże obciążenia promieniowe oraz obciążenia osiowe w obu kierunkach. Jest ono szczególnie przydatne do łożyskowań, od których wymagane jest sztywne prowadzenie w kierunku osiowym.

Łożyska kulkowe skośne dwurzędowe dwukierunkowe są szczególnie nieodporne na błędy współosiowości. Odmiana łożysk kulkowych skośnych dwurzędowych znajduje szerokie zastosowanie w motoryzacji, zwłaszcza w piastach kół samochodowych. Są to jednak łożyska o specyficznej budowie, najczęściej z dzielonym pierścieniem wewnętrznym, o odmiennych, nietypowych wymiarach i oznaczeniach. Łożyska te są coraz częściej zintegrowane z całą piastą.

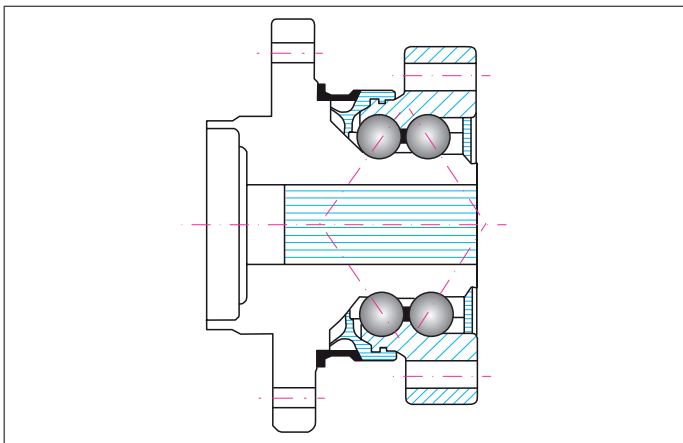

Następne rozwiązania poszły w kierunku zastosowania piast zespolonych, których kolejne wersje nazywano generacjami. Umożliwiło to uproszczenie konstrukcji, co zaowocowało skróceniem czasu montażu. W piastach zespolonych niemal całkowicie wyeliminowano awarie wynikające z nieprawidłowego uszczelnienia oraz luzu łożyska.

1.4 Piasta trzeciej generacji

W piaście trzeciej generacji zastosowano rozwiązanie polegające na tym, że łożysko jest jednocześnie piastą i zwrotnicą koła. Bieżnię wewnętrzną wykonano w piaście, natomiast dzięki zastosowaniu kołnierza mocującego na pierścieniu zewnętrznym można go przymocować do elementów zawieszenia koła i może być elementem zwrotnicy koła kierowanego. W rozwiązaniu tym nie można mówić o typowym pierścieniu wewnętrznym lub zewnętrznym łożyska. Piasta taka jest nierozbieralna. Cały zespół jest lżejszy, prosty w budowie i montażu.

Rys. 9 Piasta trzeciej generacji

Rys. 10 Piasta trzeciej generacji

1.5 Integracja systemów ABS w piastach zespolonych

Pierścień magnetyczny czujnika prędkości koła (czujnik prędkości koła - z ang. wheelspeed sensor - WSS) jest najczęściej wbudowany w zespół łożyska. Obecnie rzadko pierścienie te umieszcza się na zewnętrznej stronie przegubu, osi lub piasty koła. We wcześniejszych rozwiązaniach pierścień magnetyczny WSS był narażony na działanie czynników zewnętrznych, na przykład na nadmierne gromadzenie się soli drogowej i błota pośniegowego. Pierścień mógł być także uszkodzony wskutek nieumiejętnego demontażu półosi napędowej ze zwrotnicy lub poprzez upuszczenie półosi na podłogę. Należy pamiętać, że pierścień magnetyczny wyglądem swoim przypomina koło zębate z tym, że zęby posiadają niewielką wysokość. Niewielka różnica wysokości poszczególnych zębów, rzędu kilku dziesiątych części milimetra, może mieć wpływ na nieprawidłowe wskazania czujnika prędkości koła, a więc również na działanie ABS-u. Czujnik magnetyczny może również przenosić resztki zużytego metalu z elementów wirujących i nieruchomych, co może powodować błędne wskazania prędkości obrotowej kół pojazdu dla systemu ABS. Czyszczenie czujników i ustawianie szczeliny może często przywrócić normalne działanie systemu ABS. Jeżeli jednak pierścień magnetyczny jest skorodowany lub uszkodzony należy go wymienić na nowy.

W czasie ruchu pojazdu pierścień magnetyczny WSS obraca się wraz z łożyskiem piasty. Kiedy zęby pierścienia mijają kolejno czujnik, ich pole magnetyczne generuje w czujniku prąd przemienny. Jest to sygnał elektryczny, którego częstotliwość i amplituda rosną wprost proporcjonalnie do wzrostu prędkości obrotowej koła pojazdu. Sygnał ten jest kierowany do jednostki

Rys. 11 Przykładowy rysunek pierścienia mgt WSS

centralnej (modułu ABS), która steruje ciśnieniem płynu hamulcowego dopływającego do poszczególnych kół.

W konstrukcjach piast z wbudowanym pierścieniem magnetycznym oraz czujnikiem prędkości koła, uszczelnienie piasty zabezpiecza skutecznie przed korozją. Z czasem jednak wilgoć może przedostać się do środka, a wtedy jedynie zabezpieczenie antykorozyjne może uchronić pierścień magnetyczny przez skorodowaniem w dłuższym okresie czasu.

Podczas wymiany łożyska dwurzędowego z wbudowanym pierścieniem magnetycznym i uszczelnieniem promieniowym należy pamiętać o właściwej stronie zamontowania łożyska. Pierścień magnetyczny musi być zwrócony w stronę czujnika WSS. Zamontowanie łożyska niewłaściwą stroną zakłóci lub uniemożliwi działanie systemów ABS (ASR i ESP) wskutek braku sygnału z danego łożyska. Może to spowodować niebezpieczne zachowanie pojazdu podczas jazdy!

Aby ułatwić wykrycie strony, na której znajduje się pierścień magnetyczny, czołowi producenci łożysk umieszczają w zestawach łożysk kół specjalne karty detekcyjne. Umożliwiają one określenie aktywnej strony łożyska i dzięki temu w prosty sposób pozwalają określić prawidłowy kierunek montażu łożyska.

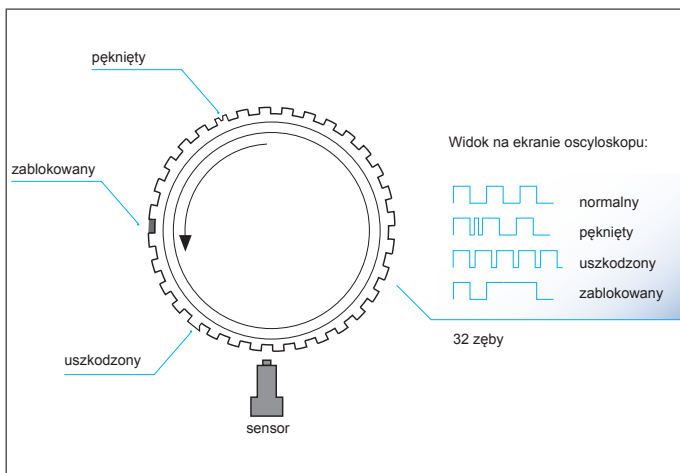

Sprawdzenie sygnału z czujnika WSS jest możliwe jedynie w specjalistycznych zakładach, ponieważ prawidłowość przebiegu sygnału jest możliwa do zaobserwowania jedynie na oscyloskopie. Sygnał prawidłowy ma kształt prostokątny o równomiernym kształcie okresów i równymi wysokościami amplitud.

Gdy przebieg sygnału na oscyloskopie jest spłaszczony, jego amplituda jest znacznie niższa w stosunku do normalnego przebiegu lub jest bardzo nierównomierna. Przyczyną słabego sygnału może być zbyt duża szczelina między czujnikiem a pierścieniem. Dzieje się tak w przypadku nadmiernego zużycia zębów pierścienia. Podobnie zniekształcony przebieg występuje w przypadku narostu dużej ilości metalicznych zanieczyszczeń na końcówce czujnika. Słaby sygnał może być także spowodowany przez wzrost wewnętrznej rezystancji czujnika lub jego obwodu elektrycznego oraz poluzowanej lub skorodowanej końcówki konektora.

W warunkach garażowych możliwa jest diagnostyka nieprawidłowości działania systemu ABS w bardzo ograniczonym zakresie. W przypadkach uszkodzeń elektrycznych wystarczy niekiedy zmierzyć multimetrem cyfrowym wartość sygnału wyjściowego czujnika WSS. Należy podłączyć bezpośrednio końcówki multimetru do czujnika WSS i obrócić kołem. Multimetr powinien wskazać napięcie, którego wartość znajduje się w opisie technicznym producenta. Jeżeli napięcie jest niskie lub nie można odczytać jego wartości należy sprawdzić rezystancję czujnika. Metoda ta ma tylko jedną zasadniczą wadę - nie daje informacji o uszkodzeniu, jeżeli nastąpiło ono w innym elemencie układu ABS.

Rys. 12 Określenie aktywnej strony łożyska przy pomocy karty detekcyjnej

Rys. 13 Przykładowy rysunek uszkodzeń pierścienia mgt

1.5.1 Po czym poznać nieprawidłowe działanie czujnika WSS?

Nieprawidłowe działanie elementów czujnika WSS może objawiać się typowym dla systemów ABS pulsowaniem pedału hamulca podczas hamowania przy niskich prędkościach jazdy samochodem oraz włączoną kontrolką (lampką) ABS-u. Dodatkowo podczas hamowania nadmierne drgania generują zwiększony poziom hałasu.

2. POLITYKA JAKOŚCI CX®

Zapewnienie najwyższej jakości produktów CX® w całym zakresie działań – od procesu produkcji, poprzez analizy jakościowe, aż do magazynowania, dystrybucji i sprzedaży jest dla nas priorytetem.

Produkty CX® produkowane są w fabrykach na całym świecie – począwszy od Polski, Niemiec, kończąc na Indiach i Japonii. Wszędzie tam, gdzie jesteśmy, gwarantowana przez nas jakość oraz profesjonalizm pozwala uzyskać produkty godne CX® i zaufania, jakim obdarzają nas Klienci. Proces technologiczny projektowany jest w oparciu o specyficzny, wypracowany przez lata model współpracy z producentami technologii przemysłowych.

Rys. 14 Zestaw naprawczy CX®

Rys. 15 Piasta CX®

Polityka jakości CX® budowana w oparciu o rosnące wymagania rynku „mobilizuje” do stałych inwestycji m.in. w sprzęt kontrolno-pomiarowy.

O wielkich rzeczach najczęściej decydują szczegóły. Urządzenia laboratoryjne używane do kontroli jakości produktów CX® pozwalają nam zagłębić się w świat atomów. Sprawdzając dokładność wykonania łożysk specjaliści laboratorium zajmują się pojedynczymi mikrometrami. Ledwo widoczny pyłek kurzu ma średnicę około 6 mikrometrów. Średnica

taką odpowiada prawie całemu zakresowi dopuszczalnej tolerancji wymiarów dla mniejszych łożysk. Niezwykle ważną rolę przy przeprowadzaniu badań odgrywa kontrola warunków pomiarowych.

Przyjmując, że 100 mm stali łożyskowej zwiększa swój wymiar o 1µm już przy podgrzaniu o 1°C można zauważyć jak bardzo istotne jest chociażby utrzymywanie stałej temperatury. Rozbudowany park maszyn do badania poziomu szumów (cichobieżności) w różnych skalach pozwala na ocenę wykonania poszczególnych elementów łożysk. Urządzenia monitorujące drgania dla różnych częstotliwości umożliwiają wykrycie uszkodzeń niewidocznych gołym okiem bez konieczności demontażu łożysk. Dodatkowo przeprowadzając pomiary chropowatości powierzchni (np. Ra, Rz) uzyskujemy pełną informację o stanie technicznym łożyska.

Pomiary odchyłek kołowości i walcowości wykonywane są na maszynie Talyrond 365 renomowanej firmy Taylor Hobson. Urządzenie to pozwala na szybsze i sprawniejsze pomiary przy dokładności pomiarów sięgających tysięcznych części mikrometra tj. kołowości, walcowości, bicia promieniowego, koncentryczności, płaskości, itp. Szybka analiza wyników pomiaru oraz ich wizualizacja pomaga w wykrywaniu poważnych wad kształtu pierścieni np. trójgraniastości. Pomiary metrologiczne są tylko jednym ze składników kontroli jakości wyrobu gotowego.

Rys. 16 Pomiar dokonywany na urządzeniu Talyrond 365

Drugim równie ważnym obszarem jest tak zwana kontrola jakości powierzchni. W tym przypadku powierzchnia detalu jest kontrolowana m.in. pod względem występowania pęknięć, zarysowań, przypaleń, wgnieceń, ognisk korozji i stanu krawędzi uszczelniających (uszczelnienia techniczne). W większości przypadków wystarczająca jest kontrola okiem nieuzbrojonym, jednakże w pewnych przypadkach wady mogą zostać wykryte tylko przy obserwacji pod znacznym powiększeniem. W tym celu w laboratorium został zainstalowany mikroskop stereoskopowy typu RZ japońskiej firmy MEIJI. Dodatkowo do mikroskopu został podpięty system przesyłu obrazu do komputera zawierający kamerę cyfrową marki Deltapix. Powyższe stanowisko kontrolne umożliwia łatwą i skuteczną kontrolę powierzchni elementów tocznych oraz bieżni łożysk.

Rys. 17 Pomiar dokonywany na urządzeniu Spectromax

Kolejnym istotnym urządzeniem wykorzystywanym podczas badania jakości produktów CX® jest spektrometr emisyjny SPECTROMAXX firmy SPECTRO. SPECTROMAXX jest wyposażony w pełni cyfrowy plazmowy generator iskrzeń, bardzo wydajny system optyczny oparty na detektorach CCD, gdzie wyeliminowano konieczność stosowania próżni. Pomiary w nim polegają na wzbudzeniu pierwiastków

występujących w materiale do świecenia i analizie powstałego w ten sposób widma. Dzięki temu urządzeniu możemy wykonywać analizę jakościową tj. jakie pierwiastki występują w badanym materiale oraz analizę ilościową, czyli w jakich ilościach one występują.

W bogatym zestawie przyrządów laboratoryjnych znajdują się ponadto urządzenia marek Bowers, Mitutoyo i Hommelwerke - czołowych producentów sprzętu laboratoryjnego na świecie. Laboratorium dysponuje maszynami mierzącymi poziom szumów podczas pracy łożysk w trzech różnych zakresach częstotliwości i dwóch skalach. Jako pierwsze w Polsce laboratorium zaczęło używać przyrządu Vibnode firmy Pruftechnik do diagnostyki łożysk. Przy wykorzystaniu analizy widmowej drgań pozwala ono ocenić usterki poszczególnych elementów łożyska. Do pomiarów dokładności wykonania wymiarów głównych łożysk stosowane są elektroniczne średnicówki 3-punktowe Bowers, transmetry Bowers o różnych zakresach pomiarowych, czujnik mikrometryczny oraz płyta pomiarowa Mitutoyo i komplet płytek wzorcowych. Przyrządy pomiarowe dokonują automatycznego przesyłu danych do komputerów. Jakość wykonania powierzchni bieżni i elementów tocznych łożysk oceniana jest przy użyciu chropowatościomierza firmy Hommelwerke. Pomiar twardości elementów odbywa się na stacjonarnym twardościomierzu w skali HRC.

Rys. 18 Montaż podzespołów motoryzacyjnych w samochodzie

Nasze wieloletnie doświadczenie we współpracy z firmami branży motoryzacyjnej pozwala nam zapewnić jak najwyższą jakość obsługi sprzedażowej. Dzięki nowoczesnym narzędziom sprzedaży konwencjonalnej i elektronicznej staramy się, aby transakcje handlowe przebiegały w sposób szybki i bezpieczny a Klient miał jak najszerszą wiedzę o naszej ofercie.

Doradcy techniczni naszej firmy każdego dnia służą radą i pomocą w dostosowaniu naszej bogatej oferty do Państwa wymagań. Systematycznie doskonalimy umiejętności oraz poszerzamy wiedzę, tak aby jak najlepiej służyć Państwu pomocą.

Poprzez ścisłą współpracę z naszymi dystrybutorami oraz partnerami handlowymi dbamy o to, aby oferowane przez nas produkty były zawsze w Państwa zasięgu.

Ważne miejsce w naszej koncepcji zapewnienia wysokiej jakości zajmują procesy logistyczne. Nowoczesny magazyn wysokiego składowania wsparty nowoczesnymi systemami informatycznymi wraz z profesjonalną kadrą dba o terminowość i bezpieczeństwo dostaw, tak aby zamówione produkty dotarły do Państwa w jak najkrótszym terminie i w najdogodniejszy dla Państwa sposób.

Rys. 19 Centrum logistyczne

Nasz nowoczesny system logistyczny zapewnia optymalną obsługę naszych Klientów, m.in. dzięki:

- doskonałej lokalizacji przy skrzyżowaniu autostrad A1 i A2, w samym centrum Polski i Europy,
- strefie regałów wysokiego składowania, zawierającej ponad 10 tys. miejsc paletowych o pojemności 8 tys. ton,
- strefie 23 windowych regałów dynamicznych o łącznej nośności ponad 600 ton, pozwalającej na składowanie w ponad 50 tys. lokalizacji,
- strefie regałów przepływowych o pojemności ponad 19 tys. kartonów o łącznej nośności 500 ton,
- systemowi inteligentnych przenośników o długości 1 km,
- linii do wewnętrznego obrotu odpadami opakowaniowymi zakończonej formowaniem prasowanych surowców wtórnych.

Nasze atuty to:

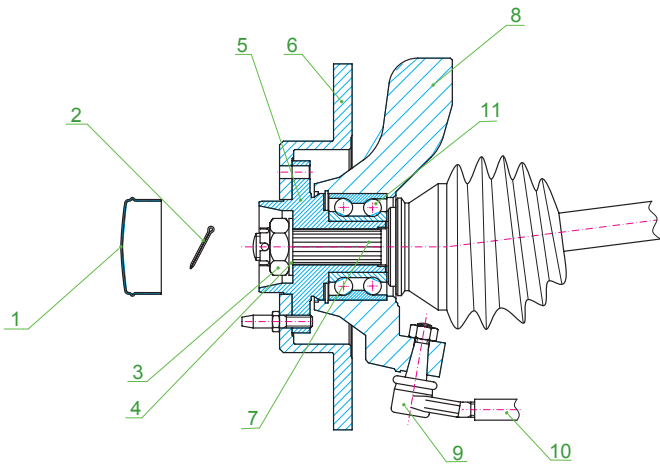

- dostępność produktów CX® w największym katalogu części zamiennych Tec Alliance,
- przestrzeganie standardów Good Manufacturing Practice,
- współpraca z Europejskim Stowarzyszeniem Producentów Części Maszyn,
- kontrola jakości produktów dokonywana w laboratorium Metrolog Sp. z o.o.

3. PODSTAWOWE ZASADY MONTAŻU I DEMONTAŻU ZESTAWÓW NAPRAWCZYCH

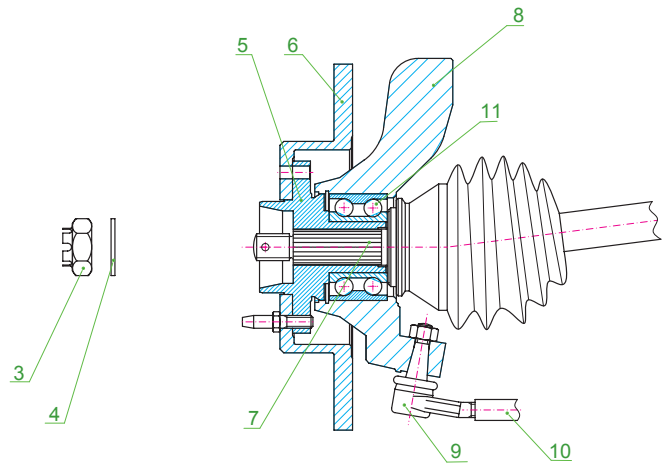

3.1 Demontaż zestawu naprawczego

1. Zdjąć zabezpieczenie nakrętki łożyska piasty koła (1) i zawleczkę (2). [Rys. 20]

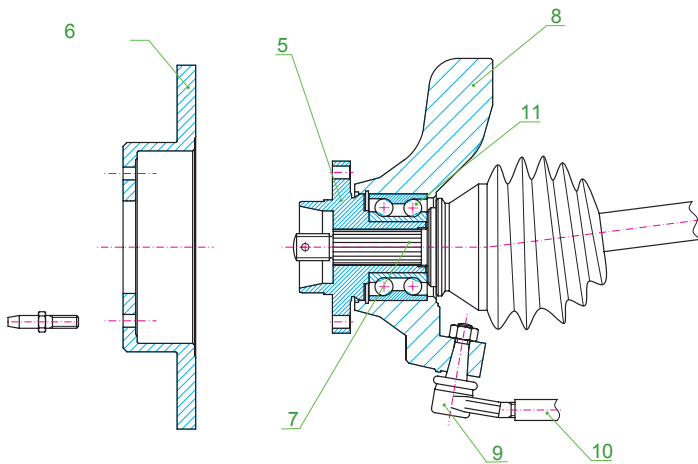

Rys. 20

2. Odkręcić nakrętkę łożyska piasty (3) i usunąć podkładkę (4). Zablokować możliwość obracania się piasty (5). [Rys. 21]

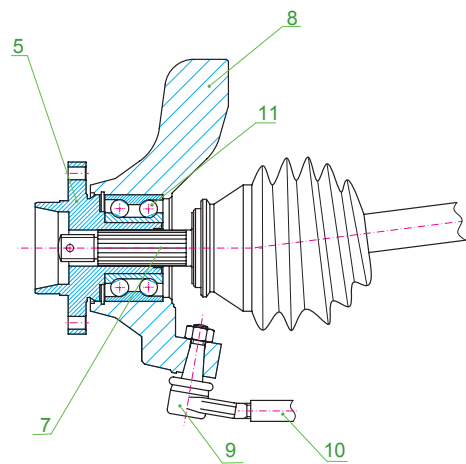

Rys. 21

3. Wymontować zacisk hamulca wraz z tarczą hamulca (6). [Rys. 22]

Rys. 22

4. Poluzować piastę (5) na wielowypuście (7) - najlepiej młotkiem o miękkim zakończeniu. Nie zdejmować. [Rys. 23]

Rys. 23

5. W przypadku układu ABS, odłączyć i zdjąć czujnik prędkości koła.

6. Poluzować nakrętki i/lub śruby mocujące zwrotnicę (8) z kolumną zawieszenia.

7. Rozpiąć końcówkę drążka kierowniczego (9) od ramienia (10). [Rys. 24]

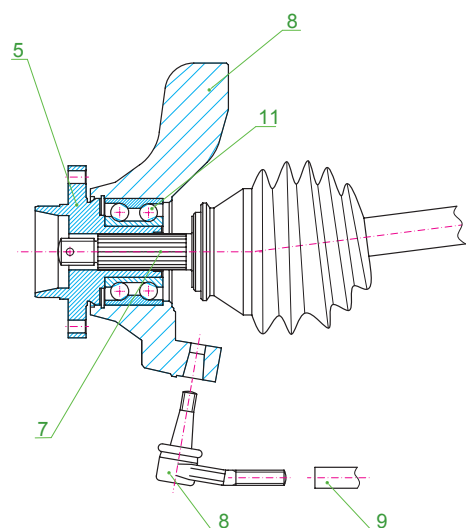

8. Odkręcić nakrętki i/lub śruby mocowania sworznia kulowego z wahaczem dolnym.

9. Wymontować sworznie kulowy ze zwrotnicy i zawiesić zakończenie osi za pomocą kawałka drutu. Wypchnąć oś (7) z piasty (5).

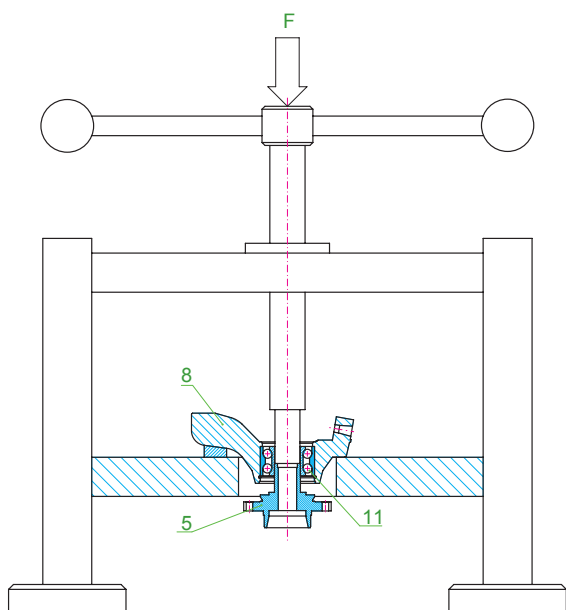

10. Odkręcić śruby łączące zwrotnicę (8) z kolumną zawieszenia i odłączyć zwrotnicę od kolumny.

11. Wymontować zwrotnicę (8) z piastą (5) i łożyskiem (11). Założyć zwrotnicę na prasę i wymontować piastę. [Rys. 25]

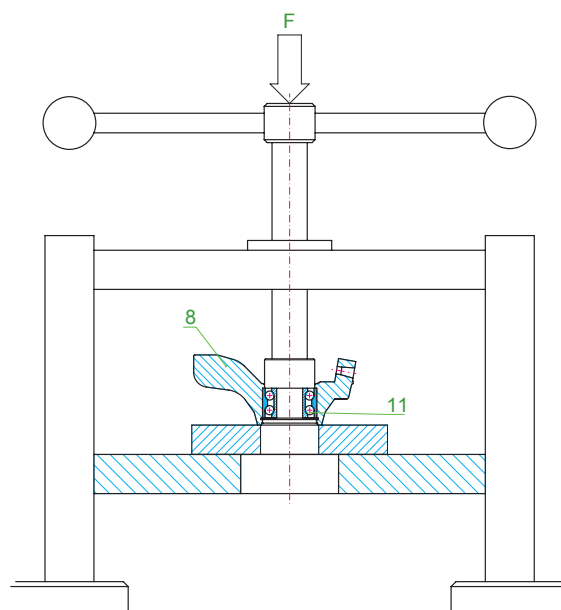

12. Zdemontować na prasie łożysko (11). [Rys. 26]

Rys. 24

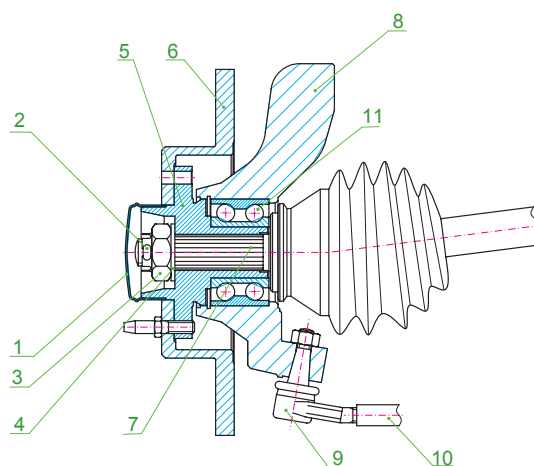

Rys. 25

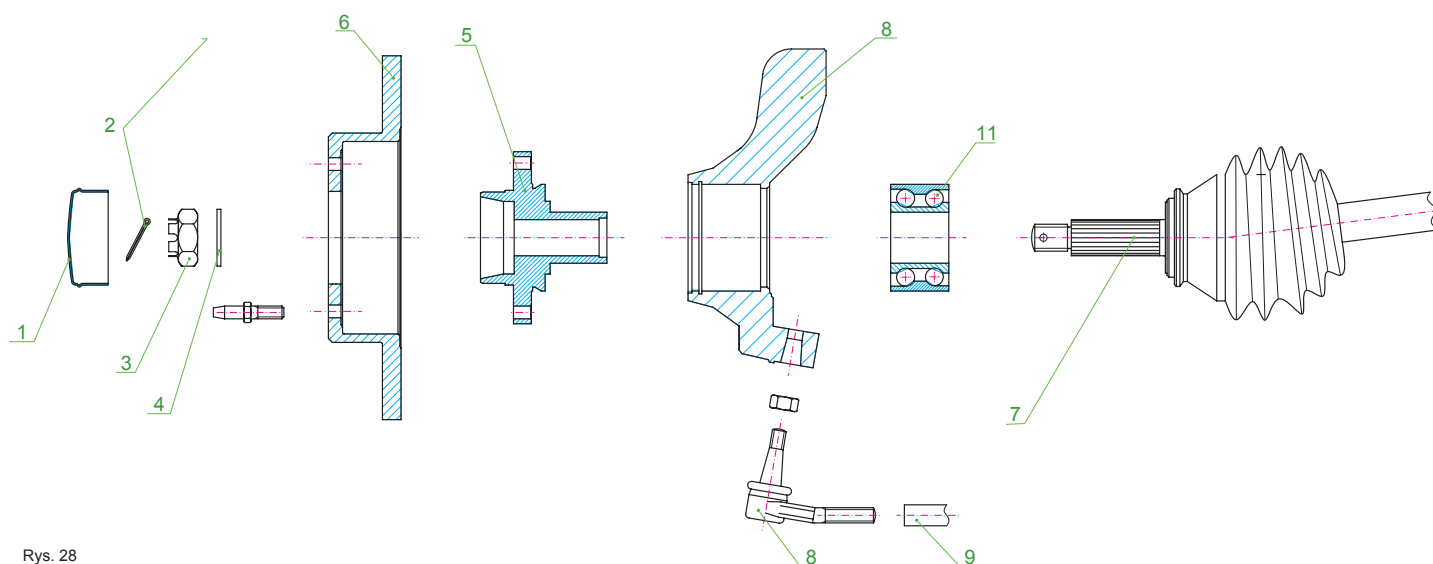

Rys. 26

3.2 Montaż zestawu naprawczego piasty koła

13. Umieścić zespół zwrotnicy (8), piasty (5) i łożysko (11) we właściwym położeniu, wsuwając oś w otwór piasty.
14. Docisnąć zwrotnicę do kołnierza kolumny zawieszenia i wkręcić nakrętki i/lub śruby, bez dokręcania.
15. Połączyć sworzeń ze zwrotnicą (8) i dokręcić nakrętkę sworznia.
16. Połączyć luźno sworzeń kulowy z wahaczem oraz drążek kierowniczy (9) z ramieniem zwrotnicy (10). Następnie dokręcić nakrętki kolumny, nakrętki i/lub śruby mocujące sworzeń z wahaczem i nakrętkę drążka kierowniczego.
17. Umieścić tarczę hamulca (6) na piaście (5) i zamontować zacisk.
18. Nakręcić nakrętkę mocującą oś z piastą (2).

Rys. 28

4. USZKODZENIA ŁOŻYSK TOCZYNYCH I ICH PRZYCZYNY

Dobór, montaż i smarowanie łożyska są podstawowymi warunkami wpływającymi na jego prawidłową i długotrwałą pracę. Temperatura prawidłowo zamontowanych i smarowanych łożysk nie powinna przekraczać 70°C, a w czasie eksploatacji powinna ustalić się na niższym poziomie.

Pracujące łożysko powinno wydawać regularny i niski dźwięk-pomruk. Jakiegokolwiek gwizdy i piski łożysk mogą świadczyć o zbyt małych luzach roboczych lub niedostatecznym smarowaniu. Z kolei grzechotanie, nierównomierny szum, dudnienie mogą oznaczać zbyt duży luz lub uszkodzenie bieżni i elementów tocznych.

Uszkodzenie łożyska może nastąpić na skutek zbyt dużego jego obciążenia, nieskutecznych uszczelnień lub za ciasnych pasowań, powodujących zbyt mały luz łożyska. Powyższe przyczyny powodują konkretne uszkodzenia, pozostawiając specyficzny ślad w uszkodzonym łożysku. Badając i prowadząc szczegółowe oględziny uszkodzonego łożyska można wyciągnąć wnioski, co do przyczyny uszkodzenia i podjąć właściwe działania zapobiegawcze (rys. 29-30).

4.1 Przyczyny uszkodzenia łożyska:

4.1.1 Niewłaściwy montaż łożyska

Źle przeprowadzony montaż łożyska można rozpoznać po rysach, nadarciach oraz wgłębieniach na bieżni łożyska. Przyczyny uszkodzeń bieżni to:

- przenoszenia sił osiowych podczas montażu powodujące wgniecenia na bieżniach łożysk kulkowych,
- przekoszenie pierścienia wewnętrznego w stosunku do pierścienia zewnętrznego z waleczkami (przekoszenie wałka w stosunku do oprawy), powodujące powstawanie zatarć na powierzchniach pracujących łożysk walcowych,
- bezpośrednie uderzenia młotka w czasie montażu, których następstwem są wyłamania obrzeża jednego z pierścieni łożyska.

AR1403

Rys. 31 Wgłębienia i rysy na waleczkach mogą powstać, gdy pierścień wewnętrzny łożyska walcowego był ukośnie wciskany w pierścień zewnętrzny z waleczkami

Nienormalny ślad pracy na bieżni łożyska może wynikać ze zbyt ciasnych pasowań, z nadmiernego zacisku wzdłużnego, z powodu błędów kształtu czopa, z niewspółosiowości czopów lub zbyt ciasnego osadzenia łożyska ruchomego.

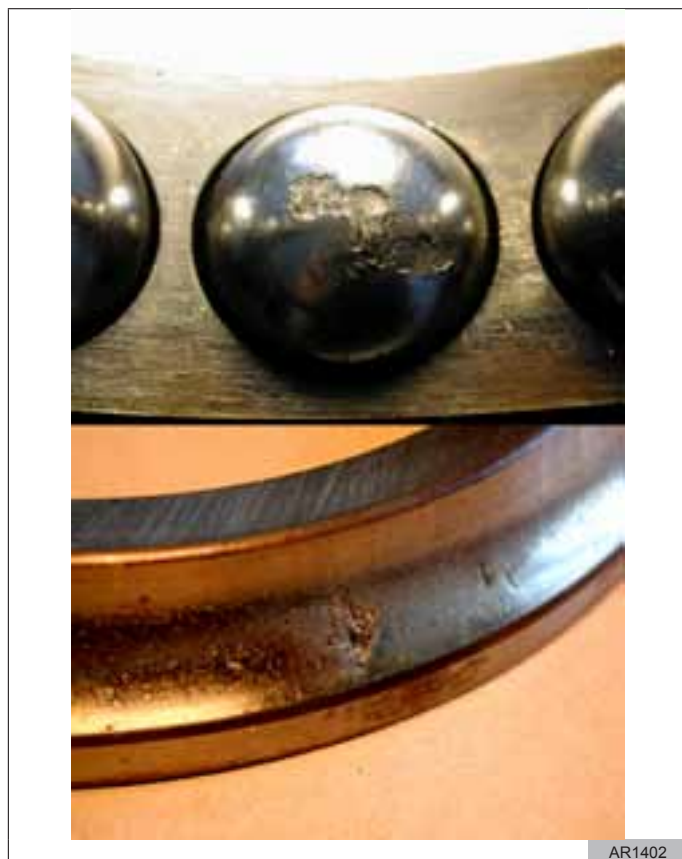

4.1.2 Błędy konstrukcyjne

Pewne osadzenie pierścienia łożyska na wale i w oprawie ma ogromne znaczenie. Jeżeli w miejscu osadzenia wykonany jest rowek to powoduje on powstanie naprężeń w pierścieniu łożyska, co w trakcie eksploatacji prowadzi do uszkodzenia bieżni. Mocowanie pierścienia przez dociągnięcie go śrubą na jego obwodzie daje podobny skutek i może nawet spowodować pęknięcie pierścienia łożyska.

AR1401

AR1402

Rys. 30 Widoczne zmęczenie materiałów elementu łożyska

AR1404

Rys. 32 Przegrzanie łożyska wskutek zbyt ciasnego pasowania w oprawie

4.1.3 Korozja

Uszkodzenia łożyska będące następstwem korozji mogą wystąpić na skutek:

- niewłaściwego przechowywania łożysk,
- nieodpowiedniego uszczelnienia łożyska, czego następstwem może być wniknięcie wody lub innych zanieczyszczeń.

AR1405

Rys. 33 Zadarcia na bieżni zewnętrznej łożyska na skutek korozji

4.1.4 Zanieczyszczenie

Zanieczyszczenie łożyska może być wynikiem:

- montażu zabrudzonych jego części,
- niewłaściwego uszczelnienia węzłów łożyskowych,
- zanieczyszczenia smaru.

4.1.5 Wgłębienia na bieżniach od elementów toczyńnych

W przypadku oddziaływania wymuszeń dynamicznych, elementy toczyne łożyska będącego w spoczynku mogą odcisnąć się na jego bieżniach (rys. 34-35).

AR1406

Rys. 34 Wgłębienia na bieżni pierścienia wewnętrznego łożyska spowodowane przeniesieniem drgań z pracującej maszyny sąsiedniej na nie obracające się łożysko

AR1407

Rys. 35 Wgłębienia na bieżniach pierścieni wewnętrznych łożysk

Wgłębienia na bieżniach i elementach toczyńnych łożyska mogą powstać w wyniku przepływu prądu elektrycznego przez łożysko (rys. 36).

AR1408

Rys. 36 Wgłębienia na bieżni pierścienia wewnętrznego łożyska powstałe w wyniku przepływu prądu

4.2 Symptomy groźnych uszkodzeń łożysk

4.2.1 Przegrzane łożysko

Przyczynami podwyższonej temperatury pracy łożyska mogą być:

- mały luz łożyska,
- nieodpowiedni rodzaj smaru plastycznego lub oleju w danych warunkach pracy,
- zbyt niski poziom smaru w łożysku,
- odkształcenie oprawy, nierówna powierzchnia podparcia,
- niewyważenie elementów wirujących,
- niesprawny układ hamulcowy przekazujący ciepło na węzeł łożyskowy,
- niewspółosiowe ustawienie.

4.2.2 Głośna praca łożyska

Zmiana charakteru i poziomu hałasu węzła łożyskowego może wynikać z następujących zdarzeń:

- pojawienie się zanieczyszczeń w oprawie łożyska (brud, piasek),
- dostanie się do oprawy łożyska środków przyspieszających korozję,
- niewystarczające smarowanie wynikające np. z nieodpowiedniego dobrania smaru w danych warunkach roboczych łożyska,
- odkształcenie oprawy łożyska,
- nierówna powierzchnia podparcia,
- zbyt mały lub zbyt duży otwór w oprawie,
- niewyważenie części wirujących (felga z oponą samochodu) powodujące szybkie zniszczenie łożyska,
- spłaszczenie elementów tocznych na skutek poślizgu,
- odkształcenie uszczelnień łożysk,
- drgania spowodowane zbyt dużym luzem roboczym łożyska,
- odkształcenie sworzni zwrotnicy lub innych części łożyskowania wskutek przegrzania,
- obracanie się pierścienia zewnętrznego w powiększonym otworze oprawy,
- uszkodzenie łożyska wskutek uderzenia spowodowanego jazdą po nierównościach z dużymi prędkościami,
- odkształcenie bieżni łożysk (niewłaściwa eksploatacja pojazdu, np. niedostosowanie prędkości jazdy do nierówności na drodze).

Dear Sir/Madam,

We are presenting another edition of the CX® repair kit catalogue which was significantly expanded as compared to the previous editions. Our catalogue is a response to the dynamically changing offer of car manufacturers and contains nearly 1000 items. In the newest issue of the catalogue you will find detailed information about our current automotive product offer. Changes in the latest catalogue do not only relate to the tables – we have also significantly expanded the theoretical sections, e.g. we present the detailed guidelines for assembly and disassembly of repair kits. What is also new is the fact that the catalogue is now available in three language versions which is a result of continuous increase of sales of our products in foreign markets.

The structure of a basic drive unit of a car, i.e. a wheel, has undergone significant modifications in the recent years. The core of each car wheel has always been a roller bearing or a roller bearing assembly. Car wheels are subject to complex radial and axial loads which result from the vehicle's movement as well as its weight. All this causes that selection of proper bearings is a key element for proper and safe operation of the vehicle's drive unit. High expectations of customers in these times of fierce competition in the automotive market result in new, improved technical solutions being developed. On one hand, structural changes contribute to better performance while on the other hand, they lead to the decrease of manufacturing and operation costs.

For your convenience, the catalogue has been divided into the following parts:

Theoretical information: information concerning bearings used in repair kits and hubs of all generations. In this part we present the quality policy of the manufacturer as well as the technology and measuring equipment used for controlling the CX® bearing quality. Additionally, this section contains a detailed description of the most frequently occurring damage of roller bearing as well as the rules of assembly and disassembly of repair kits.

I. Repair kits selection tables - they can be used for proper selection of a repair kit.

This section contains the following information:

- car make,
- type of engine and engine size; hp and kW,
- year of manufacture,
- additional details: VIN, types of breaks etc.,
- where will the repair kit be used: front or rear of the car,
- catalogue number of the kit which should be used.

II. Kit components - the components of the CX® repair kits.

III. Abbreviated list of applications - contains information on the vehicles where a given repair kit can be used.

IV. Comparisons - contains cross comparisons of the CX® repair kits with other brands.

V. OE Codes - contains OE codes of manufacturers of particular car makes for the applicable CX® index numbers.

We hope that the presented catalogue will allow you to select the most appropriate kit and we guarantee that the CX® products will ensure optimum technical and economical parameters.

The catalogue we present to you is yet another item from a series of our theme-specific catalogues presenting the CX® machine parts. Currently, we also offer catalogues presenting our industrial bearings, agricultural bearings, technical sealing and driving belts. The catalogues are available as a hard copy as well as an electronic multimedia version.

INFORMATION ON THE PRODUCT AND COMPANY

1. CX® PRODUCTION PROGRAM FOR THE AUTOMOTIVE INDUSTRY

CX® products have been used for many years in the industry, agriculture and the automotive industry. With safety, comfort and the operational reliability of vehicles in mind, we offer a range of modern and proven components for the automotive industry.

CX® products are dedicated to passenger cars and delivery vehicles:

- a broad range of over 1000 products for most makes and models of cars,
- constant quality control using the latest laboratory equipment,
- modern technological solutions such as third generation wheel hubs.

Since the very beginning, wheels in cars have been fitted onto axles using hubs. In early cars, like the horse-drawn carriages before them, wheels were fitted using sleeve bearings. The continuous development of the automotive industry led to increased vehicle speeds. Furthermore, due to the fact that bearings originally put up a great deal of rolling resistance, they were subject

to rapid wear. To remedy this, at the end of the nineteenth century manufacturers began to use hubs that incorporated ball bearings.

Currently, depending on the design, wheel bearing repair kits may include:

- single-row or double row tapered roller bearings,
- double row angular contact ball bearings,
- first generation wheel hubs,
- second generation wheel hubs,
- third generation wheel hubs.

CX® repair kits for a selected model and year of car include a set of bearings or a hub together with the other components necessary for a complete replacement of the subassembly, i.e. nuts, bolts, bushes, retaining rings, sealing rings or circlips.

Figure 1 The CX® production programme for the automotive industry

1.1 Single-row and double row tapered roller bearings

The traditional wheel bearing solution for the wheel hubs is to use two tapered roller bearings. Such bearings spread the radial and axial load evenly. Due to the fact that the axial load can only be spread by a tapered roller bearing in one direction, bearings are mounted in the hub in pairs and aligned opposite each other. The big advantage of the solution using two tapered roller bearings is the possibility of replacing damaged bearings with minimum costs. However, their assembly requires a large degree of accuracy, due to the fact that tapered roller bearings are very sensitive to assembly errors.

Figure 2 Single-row tapered roller bearings

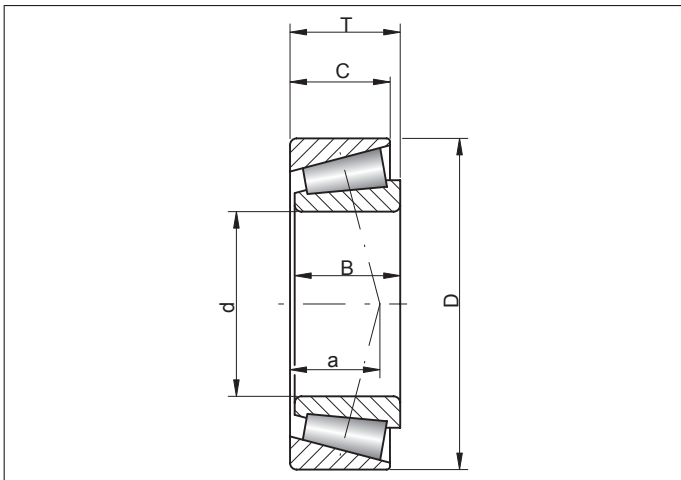

Figure 3 Single-row tapered roller bearings

1.1.1 Construction

Tapered roller bearings consist of two separate parts: the outer ring, in which sits one of the oblique bearing raceways (outer), and the inner ring on whose race is mounted the cage holding the rolling elements. The rolling elements, known as rollers, are cones with bevelled apices. Under normal operating conditions the inner ring, outer ring and rollers carry the load, while the cage separates and holds the rollers in place. The inner ring with rollers is often called an internal subassembly.

The twin-component nature of tapered roller bearings has various advantages when mounting and manipulating the bearing. In a tapered bearing, the rolling elements operate at an oblique angle to the axis of the bearing raceways, and all those forming truncated cones intersect at one point on the axis of the bearing, which ensures correct spinning of rollers in their raceways.

1.1.2 Properties

Due to their bevelled raceways, tapered roller bearings can bear any combination of radial and axial loads. The larger the angle of the outer raceway, the greater the ratio of axial load to radial load. Longer linear contact of rollers with their raceway allows a tapered roller bearing to bear heavy loads. Tapered roller bearings combine the features of transverse angular contact ball bearings, cylindrical contact ball bearings and thrust bearings. A characteristic feature of tapered roller bearings is the ability to bear axial loads in one direction. For this reason, these bearings are often mounted in pairs or larger arrangements, as in the case of single row angular contact ball bearings. The names of these arrangements are the same as for angular contact bearing arrangements (open, closed, tandem).

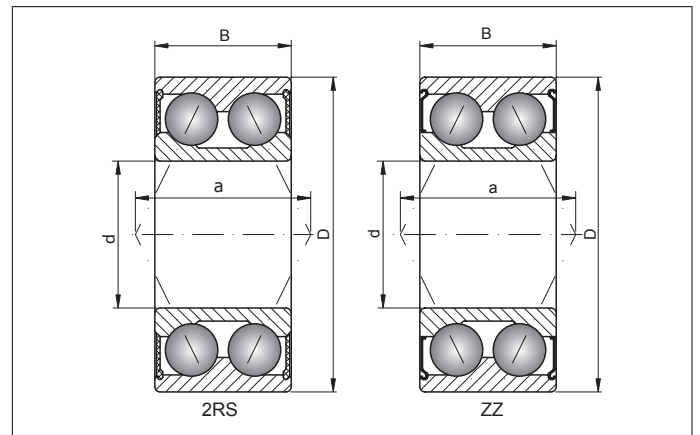

Figure 4 Double row angular contact ball bearings

1.2 First generation wheel hubs

First generation hubs are fitted with the aforementioned double-row angular contact ball bearings, in which one of the inner raceways is supported by the internal element of the drive system, and the other is pressed against it by the central hub nut. First generation hubs often on one side have a seal with an integrated magnetic ABS ring.

Such a solution takes up less space in the axial direction than in the case of using two tapered roller bearings, which is of considerable importance for design engineers. Another advantage of using angular contact ball bearings is that they are much easier to install. In addition, the sealed bearing has a sufficient supply of grease for its whole working life. As a closed component, it is resistant to contamination and does not require correction of any slack.

1.2.1 Construction

A double row angular contact type ball bearing is structurally equivalent to a pair of single-row angular contact ball bearings in an O open system. The following raceway designs may be distinguished according to operating angles:

- 25° - marked B after the bearing symbol
- 32° - with no markings after the bearing symbol
- 35° - with no markings after the bearing symbol
- 45° - marked D or DA after the bearing symbol (split inner ring).

There are also variations featuring steel, brass and polyamide cages, in both 2RS and ZZ sealed versions.

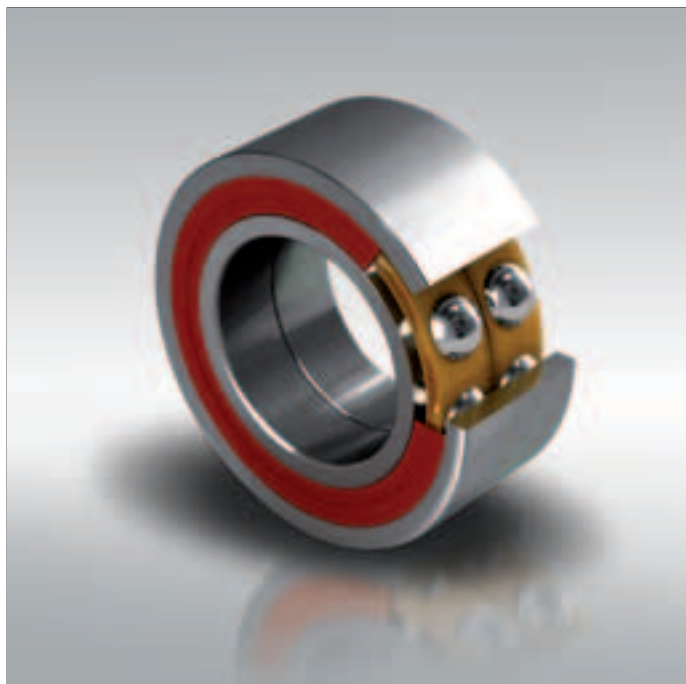

Figure 5 First generation wheel hubs

Figure 7 Second generation wheel hubs

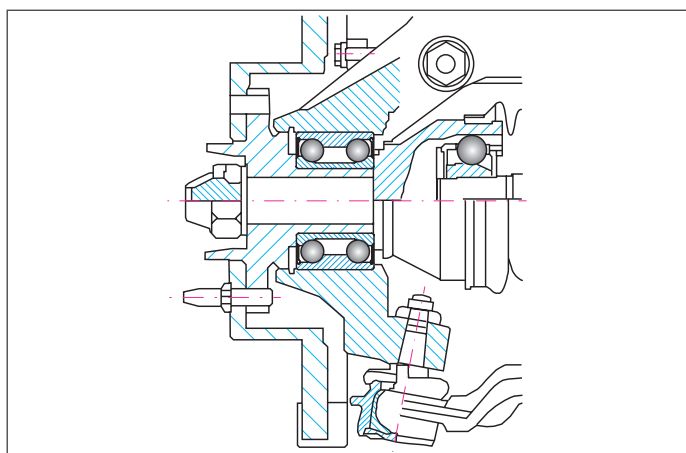

Figure 6 Second generation wheel hubs

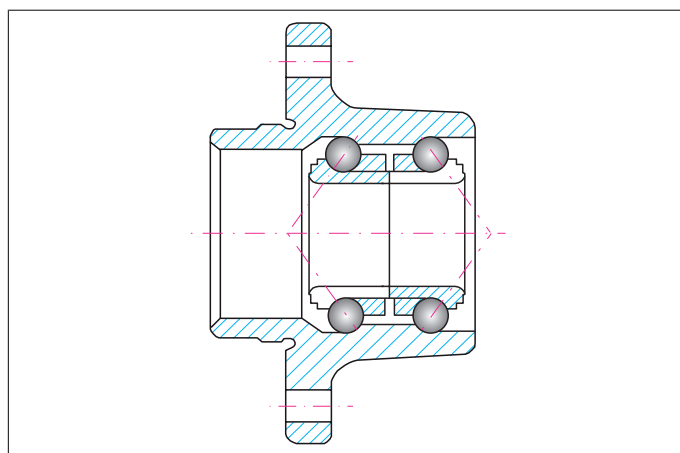

Figure 8 Second generation wheel hubs

1.2.2 Properties and applications

Bearings may take heavy radial loads and axial loads in both directions. This is especially useful in bearing arrangements from which rigidity in the axial direction is required. Two-directional double row angular contact ball bearings are particularly sensitive to misalignment. One variety of double row angular contact ball bearings is widely used in the automotive industry, especially for vehicle wheel hubs. However, these are bearings with a specific design, most often with a split inner ring, with different, non-standard dimensions and markings. These bearings increasingly tend to be integrated with the whole wheel hub.

Other solutions move towards the use of hubs, whose subsequent versions are called generations. This made it possible to simplify construction, resulting in shorter installation time. In hubs, failures caused by incorrect sealing or bearing tightness have been almost completely eliminated.

1.3 Second generation wheel hubs

In second generation wheel hubs, the use of a bearing outer ring has been abandoned, the race made in the hub's material featuring a flange. To this flange are mounted the rotating components of the braking system and the road wheel. In this way the number of parts is minimised, production costs are reduced, and the total weight of bearing components is reduced.

1.4 Third generation wheel bearings

Third-generation wheel hubs feature a solution whereby the bearing is also the wheel hub and the wheel stub. The inner raceway is made in the hub, while by using the mounting flange on the outer ring, it can be fixed to the wheel's suspension components and may be a component of a driven wheel's stub. In this solution, one cannot talk about a typical inner or outer bearing ring. Such a hub cannot be taken apart. The whole assembly is lighter, and easier to build and install.

Figure 9 Third generation wheel hubs

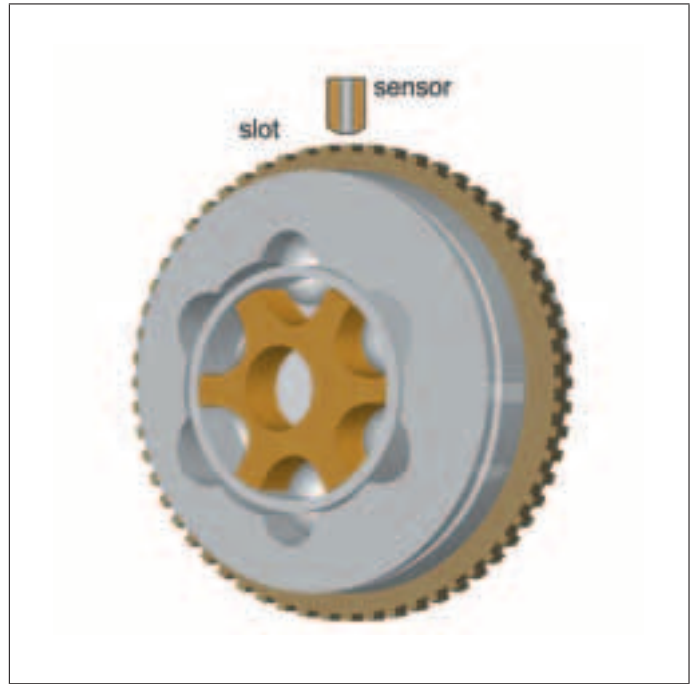

Figure 11 An example drawing of an mgt WSS ring

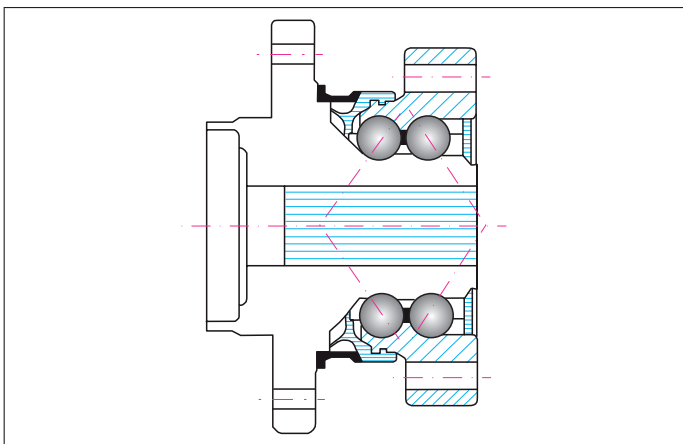

Figure 10 Third generation wheel hubs

1.5 Integration of ABS systems in hubs

Most often the magnetic ring of the wheel speed sensor (WSS) is built into the bearing assembly. Nowadays it is rare for these rings to be located on the outer side of the wheel's CV joint, axle or hub. In earlier solutions, the magnetic ring of the WSS was exposed to external factors, such as excessive accumulation of road salt and slush. This ring could also be damaged by incorrect removal of the drive shaft from the steering system or by dropping the drive shaft on the floor. It should be noted that in appearance the magnetic ring reminds one of a toothed wheel, except that these teeth are not very long. Even a slight difference in the length of the individual tooth at the level of a few tenths of a millimetre, may result in abnormal wheel speed sensor, and therefore also affect the operation of the ABS system. The magnetic sensor may also transfer swarf (the remains of metal from rotating and static components), which can cause inaccurate readings of the vehicle's wheel speed to the ABS system. Cleaning the sensors and adjusting the gap can often restore normal operation of the ABS system. However, if the magnetic ring is corroded or damaged, it should be replaced with a new one.

During movement of a vehicle, the WSS magnetic ring rotates together with the hub bearing. When the teeth of the ring in turn pass the sensor, their magnetic field generates an alternate current in the sensor. This is an electrical signal whose frequency and amplitude grow in proportion to the increase in the rotation speed of the vehicle's wheel. This signal is sent to a central unit (the ABS module) which controls the pressure of the brake fluid flowing to individual wheels.

In the construction of hubs with a built-in magnetic ring and wheel speed sensor, the hub's seal protects effectively against corrosion. In time however, moisture can penetrate and then only corrosion protection can protect the magnetic ring against corrosion over a longer time.

When replacing a double-row bearing with its built-in magnetic ring and radial seal, one should remember which is the correct side for installing the bearing. The magnetic ring must be facing the WSS sensor. Mounting the bearing back to front disrupts or prevents operation of the ABS (ASR and ESP) systems due to the lack of signal from a given bearing. This can cause dangerous behaviour of the vehicle while being driven!

To make it easier to recognise the side on which the magnetic ring is found, leading bearing manufacturers have included special detection cards in their wheel bearing kits. These make it possible to determine the active side of the bearing and allow the mechanic to easily determine the correct direction for assembly of the bearing.

Checking the WSS sensor's signal is possible only in special facilities, because the proper operation of the signal can only be observed on an oscilloscope. The correct signal is rectangular in shape with uniform cycles and equal amplitudes.

When the waveform on the oscilloscope is flattened, its amplitude is much lower than in the normal course of operation or is very uneven. The cause of a weak signal may be a gap between the sensor and the ring. This happens in the case of excessive tooth wear on the ring. A similarly distorted signal occurs when there are large amounts of metallic impurities on the sensor tip. A weak signal may also be caused by an increase in the internal resistance of the sensor or its electrical circuit, or else loose or corroded connector terminals.

In garage conditions it is possible to diagnose malfunctioning of the ABS system in only a very limited fashion. In cases of electrical failure it is sometimes sufficient to simply measure the value of the WSS sensor's output signal using a digital micrometer. This involves connecting the micrometer terminals directly to the WSS sensor and turning the driving wheel. The micrometer should indicate the voltage quoted in the manufacturer's technical specifications. If the voltage is low or cannot be read, the sensor's resistance should be checked. This method has only one major drawback - it does not provide information about the failure, if this has occurred in another component of the ABS.

Figure 12 Determining the active side of a bearing using a detection card

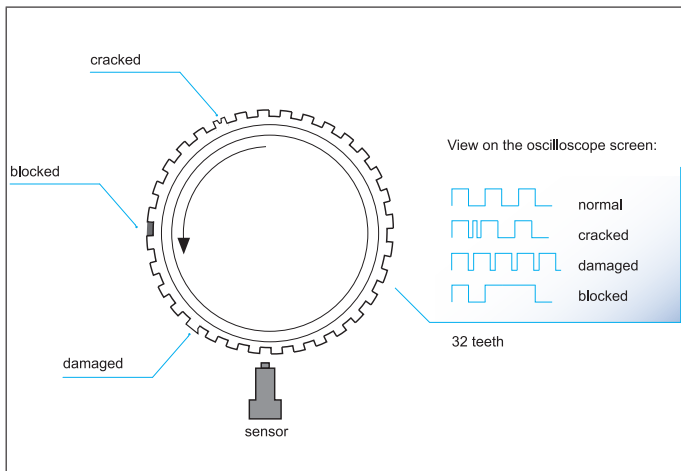

Figure 13 An example drawing of damage to an mgt ring

1.5.1 How to recognise a WSS sensor malfunction?

The malfunctioning of WSS sensor elements can manifest itself by pulsation of the brake pedal during braking when driving a car at low speeds, typical for ABS systems, and the lighting up of the ABS control light on the dashboard. In addition, excessive vibration during braking generates increased noise levels.

2. QUALITY POLICY AND CX®

Our priority is to provide the highest quality CX® products over the whole range of our operations - from production, through quality analyzes, to storage, distribution and sales.

CX® products are manufactured in factories around the world - from Poland and Germany to as far away as India and Japan. Wherever we are, our guaranteed quality and professionalism ensure our customers obtain the very best CX® products and we obtain the trust of our customers. The designed technological process is based on a specific model developed over the years of cooperation with manufacturers of industrial technology.

Figure 14 CX® repair kit

Figure 15 CX® wheel hub

The CX® quality policy, based on the growing demands of the market, „mobilizes” the company to invest constantly, among other things, in control and measuring equipment.

Great things often depend on details. The laboratory equipment used to control the quality of CX® products permits us to delve into the world of atoms. Testing the accuracy of bearings production, our laboratory specialists deal with single micrometers. A barely visible speck of dust has a diameter of about 6 microns. This diameter is the equivalent

of almost the whole range of permissible dimension tolerance for our smaller bearings. Control of measurement conditions plays an extremely important role in the tests carried out.

Assuming that a 100 mm of bearing steel increases its size by 1µm when its temperature is raised by 1 °C, one can see how very important it is to even maintain a constant temperature. An extensive machine park to study noise levels (low noise) at different scales allows us to assess the production quality of particular bearing components. Vibration monitoring devices for different frequencies can detect faults not visible to the naked eye without having to remove the bearings. In addition, by performing surface roughness measurements (e.g., Ra and Rz) we obtain full information about the technical condition of our bearings.

Measurements of circular and cylindrical deviations are performed on a Talyrd 365 machine made by the reputable company, i.e. Taylor Hobson. This device enables faster and more efficient measurements with a measurement accuracy of up to thousandths of a micrometer, i.e. circularity, cylindricity, radial runout, concentricity, flatness, etc. Quick analysis of measurement results and their visualization can help in detecting serious defects in the shape of rings, e.g. a three-point shape deviation. Metrological measurements are only one of the components of quality control for the finished product.

Figure 16 Measurements carried out on a Talyrd 365 device

Another equally important area is the so-called surface quality control. In this case, the product's surface is tested for among other things cracks, scratches, burns, dents, corrosion pitting and the condition of the sealing edges (technical seals). In most cases it is enough to check these with the naked eye, however in some cases defects can only be detected when viewed at large magnification. To this end, the laboratory has been equipped with an RZ type stereo microscope made by the Japanese company, i.e. MEIJI. In addition, this microscope has been hooked up to a system to transmit images to a computer, using a Deltapix digital camera. This testing workstation enables easy and effective monitoring of the surfaces of rolling elements and bearing raceways.

Figure 17 Measurements made on a SPECTROMAX device

Another important device used during the quality control of CX® products is the SPECTROMAXx - emission spectrometer made by the SPECTRO company. The SPECTROMAXx is equipped with a fully digital plasma sparking generator, a highly efficient optical system based on CCD detectors, which eliminates the need for a vacuum. Its measurements rely on excitation of the elements present in the material until they glow

and analysis of the resulting spectrum. Using this device it is possible to perform a qualitative analysis, i.e. which elements are present in the tested material, and quantitative analysis, i.e. the amounts in which they occur.

The considerable array of laboratory instruments used, includes also equipment made by Bowers, Mitutoyo and Hommelwerk – the leading manufacturers of laboratory equipment worldwide. Our laboratory features machines that measure the noise level during operation of a bearing in three different frequency ranges and two scales. This is the first laboratory in Poland to use the Pruftechnik company's Vibnode bearings diagnostic device. When carrying out vibration spectrum analysis, this enables us to assess the vulnerability of individual bearing components. Measuring the accuracy of the dimensions of main bearings involves the use of Bowers 3-point electronic depth gauges, Bowers sensing devices for measuring external surfaces (e.g. diameter) with various measurement ranges, a micrometer sensor and a Mitutoyo measurement plate, and a set of gauge blocks. Measurement devices automatically send their data to computers. The surface quality of raceways and rolling elements of bearings is evaluated using a surface roughness gauge made by the Hommelwerk company. Hardness measurements of bearing elements are performed on a stationary HRC scale hardness tester.

Figure 18 Installation of automotive components

Our many years of experience in working with automotive industry companies allow us to provide the highest quality sales service. Using modern tools for conventional and electronic sales, we try to ensure that business transactions are carried out rapidly and safely, and the customer has the best possible knowledge of our product range.

Every day our technical service staff offers advice and assistance in adapting our broad range of products to our customers' requirements. We are systematically improving our skills and broadening our knowledge in order to serve our customers the best possible practice.

By working closely with our distributors and business partners we make sure that our products are always within easy reach.

Logistics processes have an important place in our concept for providing high quality products. Our modern high-rise bay warehouse, supported by modern IT systems and managed by professional staff, ensures the promptness and security of deliveries, so that ordered products reach the customer in the shortest time and in the most convenient way.

Figure 19 Logistics Centre

Our modern logistics system ensures optimum service for our customers, thanks to:

- our excellent location at the junction of the A1 and A2 motorways in the very centre of Poland and Europe,
- a high-rise racks storage area containing over 10 thousand pallet spaces with the capacity of 8 thousand tonnes,
- a storage area featuring 23 dynamic elevator racks with the total capacity of over 600 tonnes and enabling storage in more than 50 thousand locations,
- a storage area featuring flow racks with the capacity of over 19 thousand boxes weighing a total 500 tonnes,
- a 1 kilometre long intelligent conveyor system,
- lines to an internal system for management of waste packaging, the end result being blocks of pressed recycled waste.

Our advantageous are:

- the availability of CX® products in Tec Alliance, the largest replacement parts catalogue,
- compliance with the standards of Good Manufacturing Practice,
- collaboration with the European Association of Machine Parts Manufacturers,
- quality control of products conducted in the laboratory of Metrolog Sp. z o.o.

3. BASIC RULES FOR INSTALLATION AND REMOVAL OF WHEEL BEARING KITS

3.1 Removing the old bearing kit

1. Remove the hub bearing nut's securing grease/dust cap (1) and split pin (2). [Figure 20]

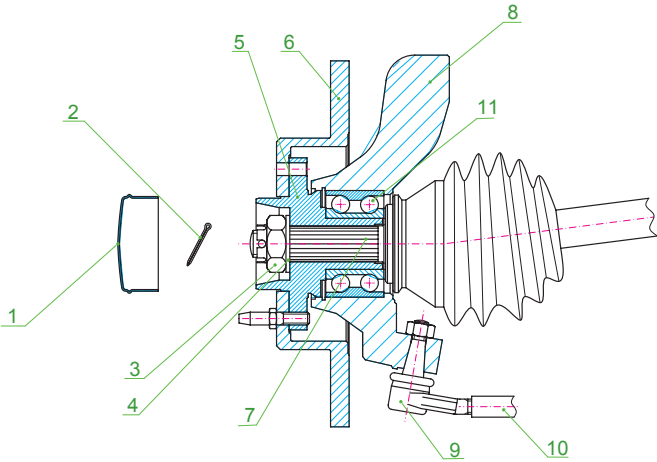

Figure 20

2. Unscrew the hub bearing's spindle nut (3) and remove its washer (4). Lock the hub to prevent it rotating (5). [Figure 21]

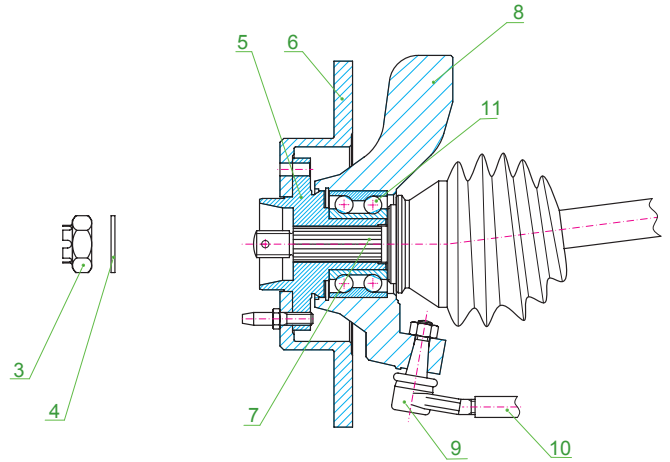

Figure 21

3. Remove the brake caliper along with the brake disc (6). [Figure 22]

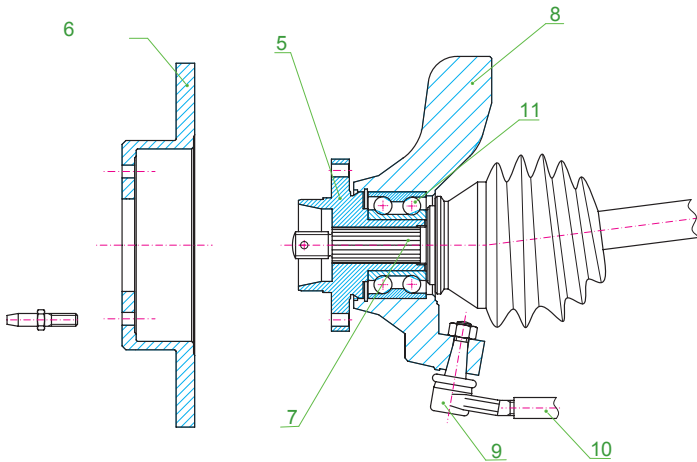

Figure 22

4. Loosen the hub (5) on its spindle (7) - best done using a mallet. Do not remove. [Figure 23]

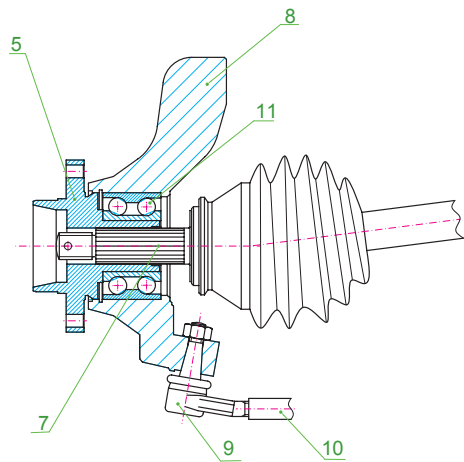

Figure 23

5. If an ABS system is installed, disconnect and remove the wheel speed sensor loom.
6. Loosen the nuts and/or bolts attaching the steering knuckle (8) to the suspension column.
7. Disconnect the end of the steering rod (9) from the arm (10).
8. Remove the nuts and/or bolts to separate the ball joint from the lower control arm.
9. Remove the ball joint from the steering knuckle and suspend the drive axle end using a piece of stiff wire. Push the drive shaft (7) out of the hub (5).
10. Remove the bolts connecting the steering knuckle (8) to the suspension column and remove the steering knuckle from the column.
11. Remove the steering knuckle (8) with the wheel hub (5) and bearing (11). Install the steering knuckle on a press and remove the wheel hub from the steering knuckle. [Figure 25]
12. Remove the bearing (11) in a press. [Figure 26]

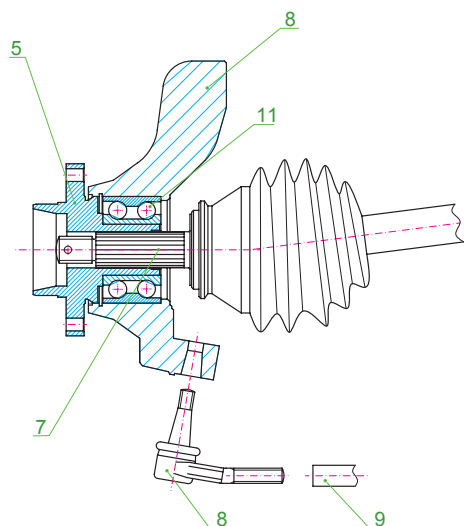

Figure 24

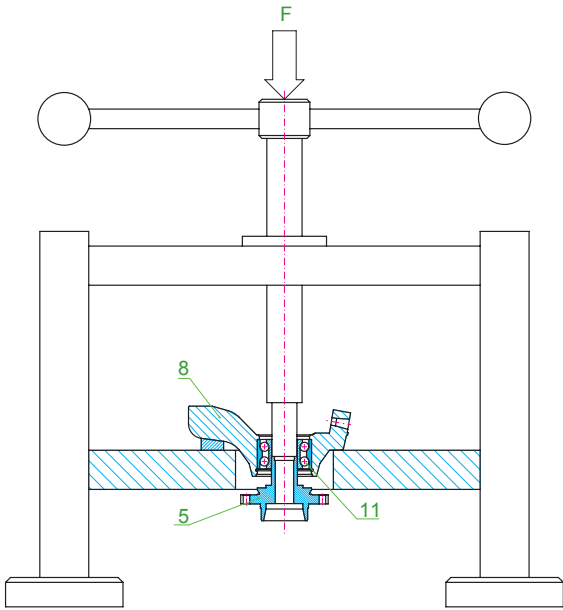

Figure 25

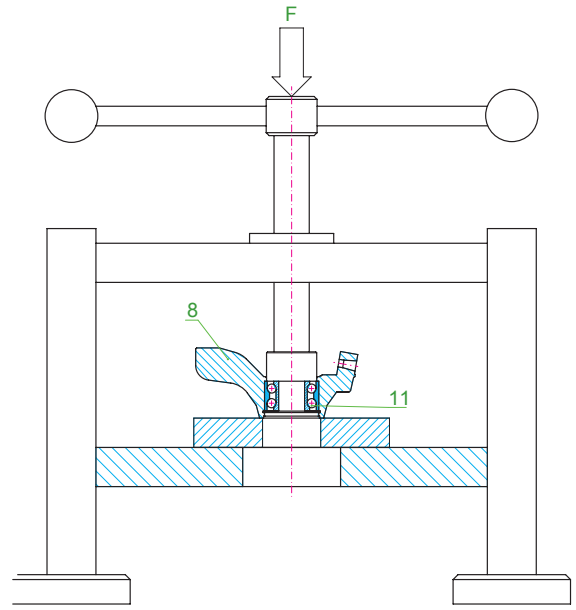

Figure 26

3.2 Installation of the wheel bearing kit

13. Position the steering gear (8), hub (5) and bearing (11) in the correct position by sliding the drive axle into the hub opening.
14. Push the steering knuckle all the way into the flange of the suspension column and install the nuts and/or bolts without tightening.
15. Connect the ball joint to the steering knuckle (8) and tighten the ball joint bolt.
16. Loosely connect the ball joint to the control arm, and the steering rod (9) to the steering arm (10). Then tighten the column nut, and the nuts and/or bolts attaching the ball joint to the control arm and the nut of the steering rod.
17. Position the brake disc (6) on the hub (5) and install its clip.
18. Screw the nut attaching the drive axle to the hub (2).

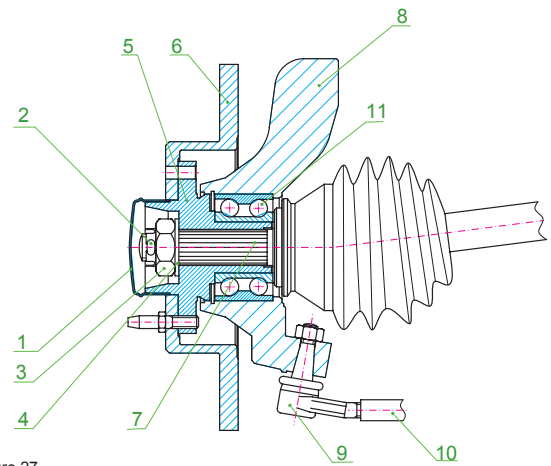

Figure 27

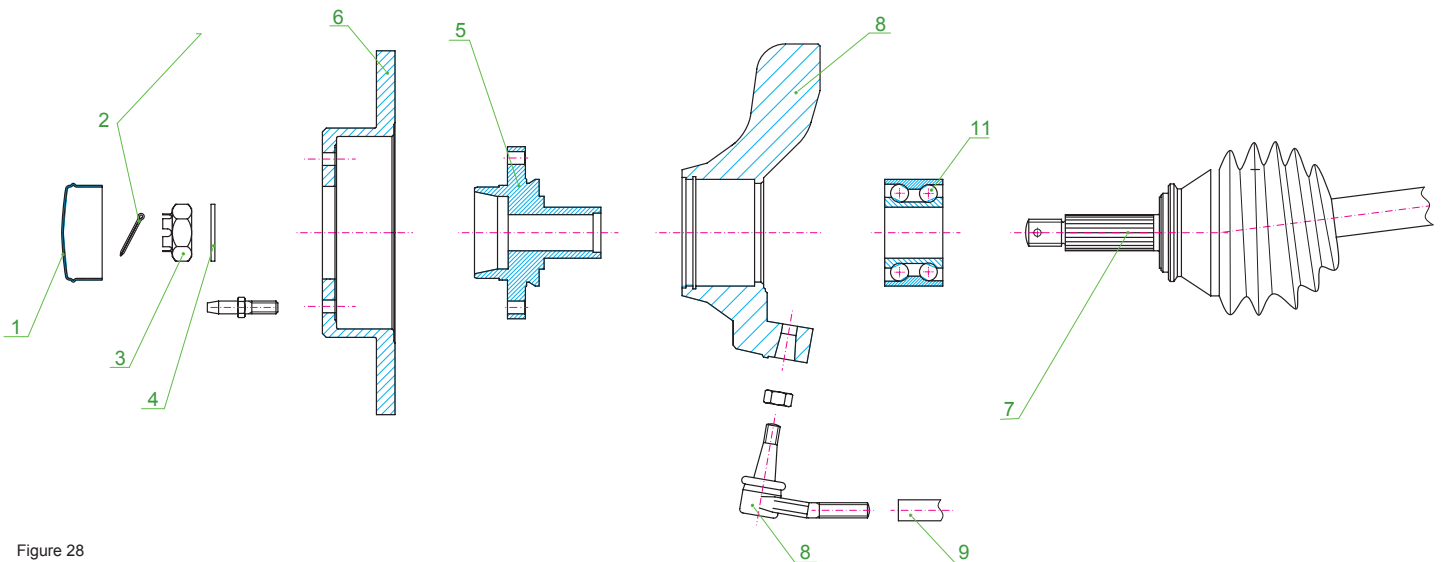

Figure 28

4. ROLLER BEARING DAMAGE AND THE CAUSES

The proper selection, installation and lubrication of bearings is essential to ensure their proper operation and long life. The temperature of properly installed and lubricated bearings should not exceed 70°C, and during operation should be set at a lower level.

A working bearing should emit a regular and low humming sound. Any whistles and squeaks of the bearing may indicate that working clearances are too small or that there is insufficient lubrication. Rattling, uneven sound or rumbling may mean too much play, or damage to the raceways and rolling elements.

Bearing damage may occur as a result of extensive load, ineffective sealing or tight fits, resulting in insufficient bearing clearance. These reasons cause specific damage, leaving specific traces in the damaged bearing. By studying and conducting a detailed examination of the damaged bearing one may draw conclusions as to the cause of its failure and take appropriate preventive action (Figures 29-30).

4.1 Reasons for bearing damage:

4.1.1 Incorrect installation of bearings

Poorly executed bearing assembly can be identified by scratches, tears and pits on the bearing raceways. Causes of damage to raceways are:

- the transfer of axial forces during assembly causing dents on the raceways of ball bearings,
- misalignment of the inner ring relative to the outer ring with rollers (roller askew to the housing), resulting in the formation of seizure points on the working surfaces of roller bearings,
- Direct impact with a hammer during installation, the consequence of which is a crack in the edge of one of the bearing rings.

AR1403

Figure 31 Indentations and scratches on rollers can arise when a roller bearing's inner ring has been obliquely pressed into the outer ring with its rollers

Abnormal traces on bearing raceways may be due to being too tightly fitted, excessive longitudinal pressure, due to an incorrectly shaped pin, misalignment of pins or too tight a fit of a moving bearing.

4.1.2 Design errors

Proper seating of the bearing rings on the shaft and in the housing is of paramount importance. If a groove is formed in the seating, this causes stresses to occur in the bearing ring, which during operation will lead to damage of the raceways. Fixing a ring by tightening it with a bolt on its circumference has a similar effect and may even cause the bearing ring to snap.

AR1401

Figure 29 Overheated roller bearing elements

AR1402

Figure 30 Visible material fatigue in a bearing element

AR1404

Figure 32 Overheating of a bearing as a result of too tight a fit in its housing

4.1.3 Corrosion

Bearing damage resulting from corrosion can occur due to:

- incorrect storage of bearings,
- incorrect sealing of a bearing, which may result in water or other contaminants penetrating the bearing.

AR1405

Figure 33 Tears in the outer race of bearing due to corrosion

4.1.4 Contamination

Contamination of a bearing may be caused by:

- installation of dirty parts,
- incorrect sealing of the bearing's units,
- contamination of the grease used on the bearing.

4.1.5 Pits on the raceways of rolling elements

In the event of dynamic impacting, a bearing's rolling elements at rest may impress on its raceways (Figs. 34-35).

AR1406

Figure 34 Pits on the raceway of the inner ring in a bearing due to the transfer of vibrations to the non-rotating bearing from a machine operating adjacent to it.

AR1407

Figure 35 Pits on the raceways of bearings' inner rings

Pits on the raceways and rolling elements of a bearing may result from the flow of an electrical current through the bearing (Figure 36).

AR1408

Figure 36 Pits on the raceway of the inner ring in bearing as a result of current passing through it.

4.2 Symptoms of serious damage to bearings

4.2.1 Overheated bearing

The reasons for an increase in a bearing's temperature may be:

- too small bearing clearance,
- the wrong kind of grease or oil under given operating conditions,
- too low level of grease in the bearing,
- housing deformation or uneven support surfaces,
- an imbalance of rotating components,
- misaligned setting,
- a faulty brake system transferring heat to a bearing unit.

4.2.2 Noisy bearing operation

A change in the nature and level of a bearing's operating sound may be due to the following events:

- the appearance of contaminants in the bearing housing (dirt, sand),
- agents that accelerate corrosion entering the bearing housing,
- insufficient lubrication due for instance to the selection of the wrong grease for given operating conditions of the bearing,
- deformation of the bearing housing,
- an uneven support surface,
- too small or too large an opening in the housing,
- an imbalance of rotating parts (car's wheel and tyre) causing rapid destruction of the bearing,
- a flattening of rolling elements due to slip,
- deformation of bearing seals,
- vibrations caused by excessive operating looseness in the bearing,
- deformation of the steering kingpin or other bearing parts due to overheating,
- rotation of the outer ring in an enlarged opening in the housing,
- deformation of bearing raceways (incorrect operation of the vehicle, such as inappropriate speed over bumps in the road),
- bearing damage due to heavy impact caused by driving over uneven surfaces at high speeds.

Уважаемые Господа!

Мы даем вам следующее издание каталога на ремонтные комплекты CX®, на этот раз значительно шире по сравнению с предыдущими версиями. Наше предложение в каталоге это ответ на быстро меняющееся предложение производителей автомобилей, которое в настоящее время охватывает почти 1000 наименований. В последнем издании каталога Вы найдете подробную информацию о нашей текущей автомобильной продукции. Изменения в данном каталоге касаются не только информации собранной в таблицах, но в значительной степени мы расширили теоретические главы, в которых найдёте подробное описание установки и демонтажа ремкомплектов. Еще одна новая функция это трехязычная версия каталога, которая является следствием устойчивого роста продаж нашей продукции на внешних рынках.

Конструкция колеса автомобиля на протяжении последних времён подвергала многим изменениям. Сердцем любого колеса автомобиля от начала его существования до сегодняшних времён является подшипник качения или несколько подшипников качения, работающих вместе. Ведущие колеса подвергают сложным радиальным и осевым нагрузкам. Поэтому подбор соответствующего подшипника является очень важным фактором для правильной и безопасной езды. Высокие ожидания наших клиентов, при жесткой конкуренции в автомобильной промышленности, приводят к созданию новых, более совершенных технологических решений. Структурные изменения, с одной стороны имеют большое влияние на производительность, с другой стороны, уменьшают затраты связанные с производством и эксплуатацией.

Для вашего удобства каталог разделен на следующие разделы:

Теоретическая информация: информация о подшипниках, используемых в ремонтных комплектах и ступицах в сборе всех поколений. В этом разделе мы представляем политику качества производителя, а также методы измерений и оборудование, используемое для контроля качества подшипников CX®. Кроме того, глава содержит подробное описание наиболее распространенных дефектов в подшипниках качения, а также принципы установки и демонтажа ремкомплектов.

I. Таблицы подбора комплектов - используются для выбора правильного ремкомплекта.

Этот раздел содержит информацию о:

- марке машины,
- типе и мощности двигателя,
- годе выпуска,
- дополнительных деталях, таких как номер шасси, тип тормоза и т.д,
- применимости комплекта: спереди, сзади автомобиля,
- номере комплекта, который следует использовать.

II. Состав комплекта - комплектующие, которые входят в состав комплекта CX®.

III. Сокращённый список применимости - включает в себя информацию о том, в каких автомобилях комплект используется.

IV. Кросс лист - включает в себя т.н. кроссы, аналоги CX® по отношению к другим брендам.

V. Номера OE - содержит номера OE производителей различных марок автомобилей для соответствующих наименований CX®.

Мы надеемся, что настоящий каталог поможет вам выбрать наиболее подходящий комплект, а мы даем гарантию, что продукция CX® обеспечивает оптимальные технико - экономические параметры.

Каталог, который мы отдаем в ваши руки это очередной каталог из серии тематических каталогов изображающих части машин CX®. В настоящее время доступны для клиентов каталоги промышленных подшипников, сельскохозяйственных подшипников, технических уплотнений и ремней. Каталоги кроме своей бумажной формы доступны также в мультимедийном формате

1. ПРОИЗВОДСТВЕННАЯ ПРОГРАММА CX® ДЛЯ МОТОРИЗАЦИИ

Продукция CX® в течение многих лет широко используется в промышленности, сельском хозяйстве и моторизации. Заботясь о безопасности, комфорте и надежности эксплуатации транспортных средств, мы предлагаем широкий спектр современных и проверенных автозапчастей.

Наше предложение распространяется на легковые и коммерческие автомобили:

- широкий ассортимент, свыше 1000 продуктов для большинства марок и моделей автомобилей;
- постоянный контроль качества с использованием современной оборудованной лаборатории;
- современные технологические решения, в том числе, ступицы колес III поколения.

Колеса в машине с самого начала своей истории крепились к оси с помощью ступицы. В самых ранних автомобилях, как и в экипажах, колеса крепились к оси с помощью подшипников скольжения. Постоянное

развитие автомобильной промышленности способствовало увеличению скорости транспортных средств. В связи с тем, что первоначальные подшипники оказывали большое сопротивление качению, они были подвержены более быстрому износу. Чтобы избежать этого, в конце XIX века начали использовать ступицы с подшипниками качения.

В настоящее время, в зависимости от конструкции, ремонтный комплект ступицы включает

- однорядные или двухрядные конические подшипники;
- двухрядные радиально-упорные подшипники;
- ступицы I поколения;
- ступицы II поколения;
- ступицы III поколения;

Для выбранной модели и года выпуска автомобиля в ремонтных комплектах CX®, вы найдете подшипники или ступицу вместе с другими элементами, необходимыми для монтажа компонентов, в том числе гайки, болты, втулки, стопорные кольца или уплотнительные кольца.

Рис. 1 Производственная программа CX® для моторизации

1.1 Однорядные и двухрядные конические подшипники

Традиционным технологическим решением для подшипников ступицы является использование двух конических подшипников. Такие подшипники воспринимают осевые и радиальные нагрузки. В связи с тем, что осевые нагрузки на один конический подшипник могут восприниматься только в одном направлении, подшипники в ступице устанавливаются парами, друг напротив друга. Большим преимуществом данного технологического решения с двумя подшипниками является возможность замены поврежденного подшипника с минимальными затратами. Тем не менее, необходимо внимательно и с высокой точностью осуществлять монтаж так как конические подшипники очень чувствительны на ошибки в монтаже.

Рис. 2 Однорядный конический подшипник

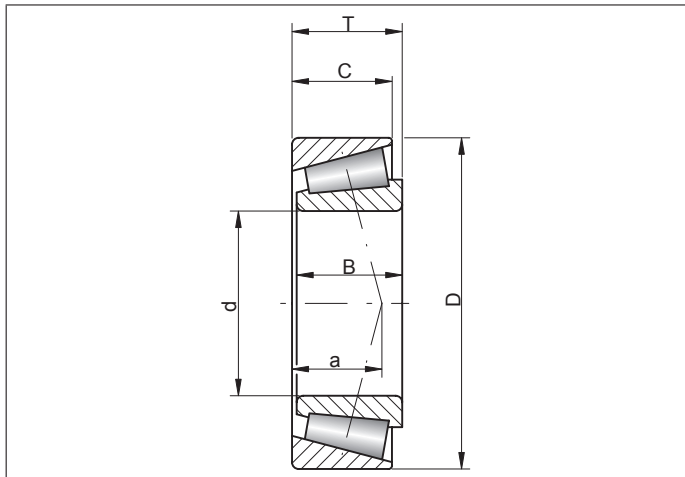

Рис. 3 Однорядный конический подшипник

1.1.1 Строение

Конические подшипники состоят из двух отдельных частей: наружного кольца, в котором находится одна из дорожек качения подшипника (наружная), и внутреннего кольца, на дорожке которого расположен сепаратор с элементами качения. Элементы качения, так называемые ролики, представляют собой конические элементы со срезанными макушками. При нормальных условиях эксплуатации внутреннее кольцо, наружное кольцо и элементы качения воспринимают нагрузку в то время как сепаратор разделяет и удерживает элементы качения.

Внутреннее кольцо с элементами качения часто называют «внутренним кольцом в сборе».

Конструкция конических подшипников из двух частей имеет ряд преимуществ для монтажа и регулирования подшипника. В коническом подшипнике элементы качения работают на расположенных под определённым углом к оси подшипника дорожках, причем все, формирующие усеченный конус, пересекаются в одной точке на оси подшипника, что обеспечивает правильную работу роликов на дорожке качения.

1.1.2 Свойства

Благодаря углу контакта дорожки качения, конический подшипник может воспринимать любую комбинацию радиальных и осевых нагрузок. Чем больше угол контакта наружного кольца, тем больше соотношение осевой и радиальной нагрузки. Длинное линейное соприкосновение ролика с дорожкой качения позволяет коническому роликовому подшипнику переносить тяжелые нагрузки. Конические подшипники сочетают в себе характеристики поперечных радиально-упорных, цилиндрических и упорных шарикоподшипников. Характерной особенностью конических подшипников является способность воспринимать осевые нагрузки в одном направлении. Поэтому эти подшипники часто устанавливаются в парах или системах так, как в случае однорядных радиально-упорных шарикоподшипников. Названия систем аналогичны системам радиально-упорных подшипников (открытые, закрытые, тандем).

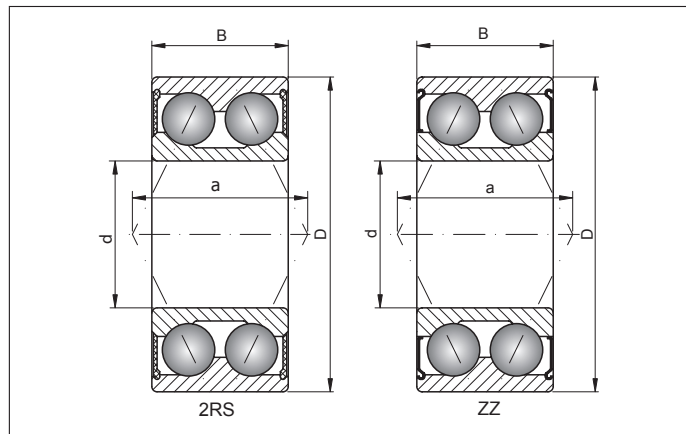

Рис. 4 Двухрядный радиально-упорный подшипник

1.2 Ступица первого поколения

Ступица в сборе первого поколения оснащена вышеупомянутым двухрядным радиально-упорным подшипником, в котором одна из внутренних дорожек качения примыкает к внутреннему элементу привода, а другая прилегает к ней посредством центральной гайки ступицы. Ступицы первого поколения часто на одной стороне имеют уплотнительное кольцо со встроенным магнитным кольцом АБС.

Такое технологическое решение способствует занятию меньшего места в осевом направлении, в отличие от использования двух конических подшипников, что имеет огромное значение для инженеров. Еще одним преимуществом использования радиально-упорных подшипников является значительно более упрощенная установка. Кроме того, герметичный подшипник имеет достаточное количество смазки в течении всего срока эксплуатации и, как закрытый элемент, устойчив к загрязнению и не требует коррекции люфта.

1.2.1 Строение

Двухрядный радиально-упорный подшипник по своему строению эквивалентен паре однорядных радиально-упорных подшипников в открытой системе O. Различаем следующие способы расположения дорожки качения в соответствии с углом контакта:

- 25° - знак B за символом ступицы
- 32° - без обозначения за символом ступицы
- 35° - без обозначения за символом ступицы
- 45° - знак D или DA за символом ступицы (разделенное внутреннее кольцо)

Возможны варианты со стальным сепаратором, с латунным сепаратором и сепаратором из полиамида, как в закрытых вариантах 2RS, так и ZZ.

Рис. 5 Ступица первого поколения

вращающиеся компоненты тормозной системы и колесо. Таким способом ограничивается количество элементов, снижаются издержки производства, а также снижается вес элементов подшипника.

Рис. 7 Ступица второго поколения

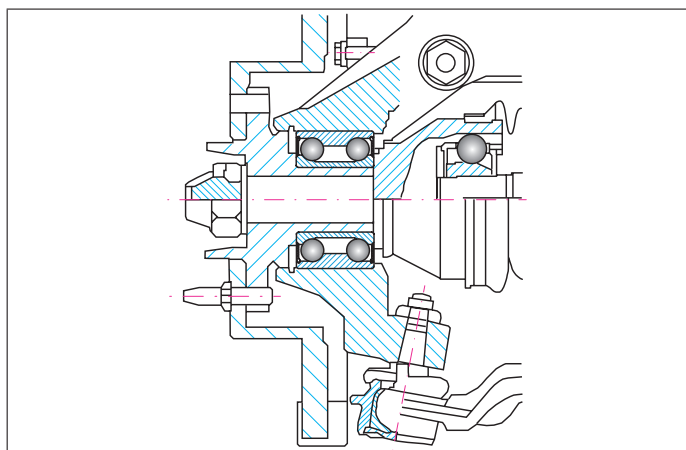

Рис. 6 Ступица первого поколения

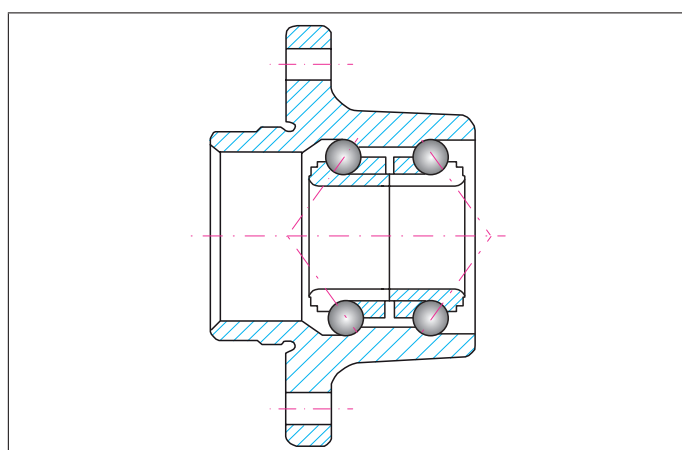

Рис. 8 Ступица второго поколения

1.2.2 Свойства и применение

Подшипник способен переносить тяжелые радиальные и осевые нагрузки в обоих направлениях. Это является особым преимуществом подшипников, от которых требуется четкое движение в осевом направлении. Двухрядные двунаправленные радиально-упорные подшипники являются особенно чувствительными к перекосам. Множество двухрядных радиально-упорных подшипников широко используется в автомобильной промышленности, особенно в ступицах колес автомобилей. Тем не менее, такие ступицы имеют специфическое строение, чаще всего с разъемным внутренним кольцом различных нестандартных размеров. Такие подшипники все чаще соединены со ступицей.

Дальнейшие технологические решения были направлены на использование ступиц в сборе, последующие версии которых называются поколениями. Это дало возможность сделать конструкцию проще, следствием чего стало сокращение времени установки. Почти полностью в ступицах в сборе были исключены сбои работы, вызванные неправильным уплотнением и люфтом подшипника.

1.3 Ступица второго поколения

В конструкции ступицы в сборе второго поколения отказались от наружного кольца подшипника, используя дорожку качения из материала ступицы, имеющей фланец. К фланцу монтируются

1.4 Ступица третьего поколения

В конструкции ступицы в сборе третьего поколения оставлено технологическое решение, согласно которому подшипник является одновременно и ступицей, и шкворнем колеса. Внутреннее кольцо установлено в ступице, а благодаря применению монтажного фланца на наружном кольце, его можно прикрепить к элементам подвески колеса, и он может выступать как компонент шкворня колеса. В описанном технологическом решении нельзя говорить о типичном внутреннем или наружном кольце подшипника. Такую ступицу невозможно разобрать на части. Вся структура является более легкой, простой в сборке и установке.

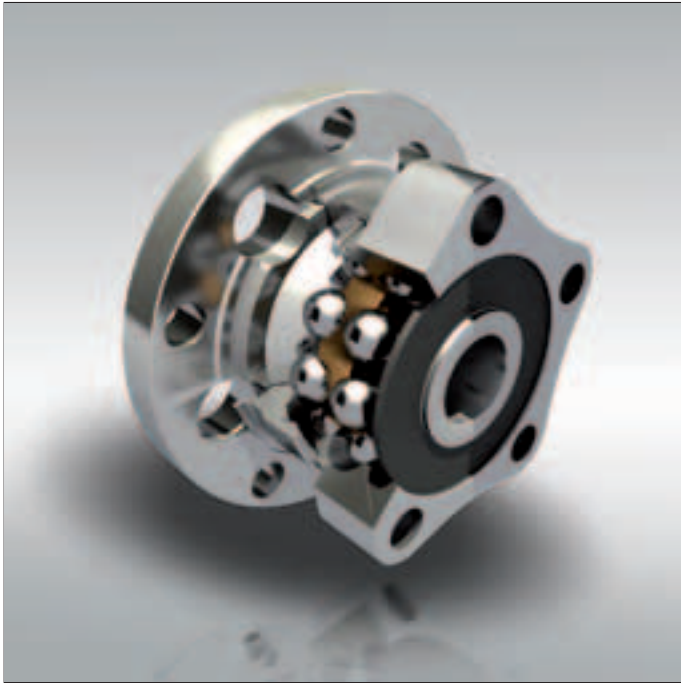

Рис. 9 Ступица третьего поколения

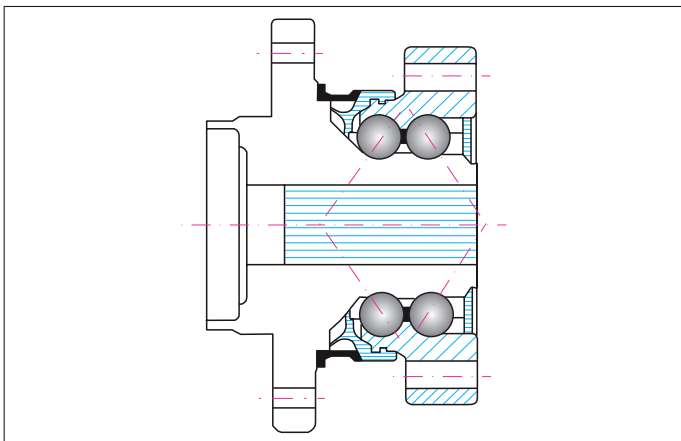

Рис. 10 Ступица третьего поколения

1.5 Объединение системы АБС в ступицах в сборе

Чаще всего магнитное кольцо датчика скорости вращения колеса (датчик частоты вращения колеса – (с англ.) wheel speed sensor - WSS) встроен в подшипник. В настоящее время эти магнитные кольца редко размещаются на внешней стороне шруса, оси или ступицы колеса. В предыдущих технологических решениях WSS подвергался воздействию внешних факторов, например, накоплению дорожной соли или слякоти. Магнитное кольцо также могло быть повреждено во время неправильного демонтажа оси приводного вала или в результате ее падения на пол. Необходимо помнить, что магнитное кольцо с виду напоминает зубчатое колесо однако зубья имеют небольшую высоту. Небольшая разница в высоте отдельных зубьев, порядка нескольких десятых долей миллиметра, может вызвать ошибочные показания датчика скорости вращения колеса, а следовательно, повлиять на работу АБС. Магнитный датчик также может реагировать на остатки металла вращающихся и неподвижных компонентов, что может привести к неточным показаниям скорости вращения колес для системы АБС. Очистка датчиков и регулировка слота часто может привести к восстановлению нормальной работы АБС. Тем не менее, если магнитное кольцо было подвержено коррозии или повреждено, необходимо его полностью поменять.

Во время движения транспортного средства магнитное кольцо WSS вращается вместе с подшипником ступицы. Когда зубья колеса по очереди встречаются с датчиком, их магнитное поле создает переменный ток в датчике. Это электрический сигнал, частота и амплитуда которого увеличиваются прямопропорционально увеличению скорости вращения

колеса транспортного средства.

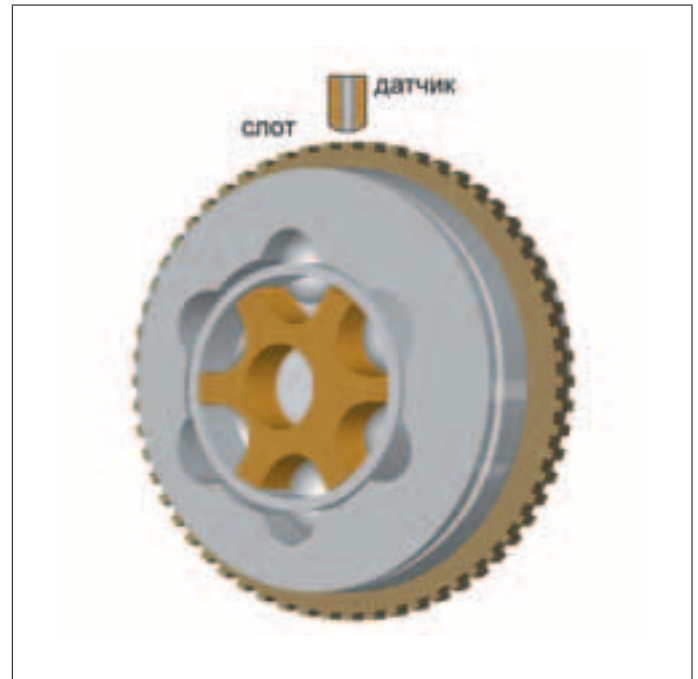

Рис. 11 Примерный рисунок магнитного кольца для датчика скорости вращения колеса

Этот сигнал поступает на центральный блок АБС, который контролирует давление тормозной жидкости, поступающей к колесам.

В ступицах с АБС уплотнение ступицы эффективно обеспечивает ступицу от коррозии. Со временем, однако, влага может проникать внутрь, и тогда только антикоррозийная защита может предотвратить появление ржавчины на магнитном кольце в течение длительного времени.

Во время замены двухрядного подшипника со встроенным магнитным кольцом и радиальным уплотнением, необходимо помнить о правильности выбора стороны установки подшипника. Магнитное кольцо должно быть направлено в сторону датчика WSS. Неправильный монтаж подшипника нарушит или остановит работу АБС (ПБС и ЭКУ) из-за отсутствия сигнала от данного подшипника. Это может привести к появлению опасности во время движения автомобиля!

Для облегчения правильного выбора стороны, с которой находится магнитное кольцо, ведущие производители подшипников размещают в комплектах подшипников особые детекционные ленты. Они указывают на активную сторону подшипника и, благодаря этому позволяют правильно определить направление установки подшипника.

Проверка сигнала с датчика WSS возможна только в специализированных автосервисах, так как правильно считать сигнал возможно только на экране осциллографа. Правильный сигнал имеет прямоугольную форму с равномерными периодами и амплитудами колебаний.

Когда сигнал на экране осциллографа выравнивается, его амплитуда становится значительно меньше, чем в ходе его обычного распространения или очень неравномерна. Причиной слабого сигнала может быть слишком большой слот между датчиком и кольцом. Это происходит в случае чрезмерного износа зубьев магнитного кольца.

В гаражных условиях возможна только ограниченная диагностика неисправности АБС. В случае электрической неисправности иногда достаточно просто измерить цифровым мультиметром значение входящего сигнала датчика WSS. Для этого необходимо напрямую подсоединить концы мультиметра к датчику WSS и повернуть кольцо.

Мультиметр должен показать значение напряжения, которое находится в технической спецификации изготовителя. Если показания мультиметра слишком малы или невозможно их снять, необходимо проверить сопротивление датчика. Этот метод имеет только один существенный недостаток - он не дает информации о наличии проблемы, если она появилась в других элементах системы АБС.

Рис. 12 Определение активной стороны подшипника с помощью детекционной ленты

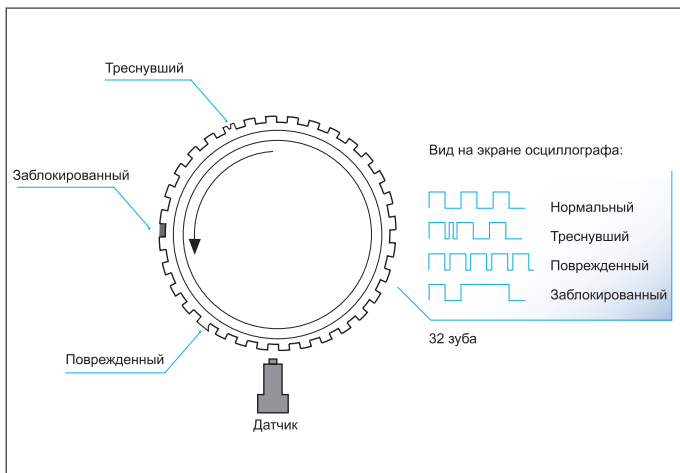

Рис. 13 Примерный рисунок поврежденного магнитного кольца

1.5.1 Как можно узнать о неисправности датчика WSS?

Проявлением неисправности элементов датчика WSS может быть типичная для АБС пульсация педали тормоза при торможении на низкой скорости, а также светящийся индикатор АБС. Кроме того, во время торможения появляется чрезмерная вибрация, вызывающая повышенный шум.

2. Политика качества CX®

Обеспечение высокого качества продукции CX® в целом ряде действий – начиная с производственного процесса, через качественный анализ, вплоть до хранения, распространения и продажи – является нашим приоритетом.

Продукция CX® производится на заводах во всем мире, начиная от Польши и Германии, заканчивая Индией и Японией. Где бы мы ни находились, гарантируемое нами качество и профессионализм позволяют нам производить продукцию CX®, заслуживающую доверия наших клиентов. Технологический процесс разработан на основе конкретной, совершенствуемой в течение нескольких лет модели сотрудничества с производителями промышленных технологий.

Рис. 14 Ремонтный комплект CX®

Рис. 15 Ступица CX®

Политика в области качества CX® строилась опираясь на растущих потребностях рынка и привлекает к постоянным инвестициям, в том числе в контрольно-измерительные приборы.

О великих вещах часто решают детали. Лабораторное оборудование, используемое для контроля качества продукции CX®, позволяет нам «окунуться» в мир атомов. Проверая точность производства подшипников, специалисты лаборатории занимаются отдельными

микрометрами. Едва заметные пылинки имеют диаметр около 6 мкм. Такой диаметр эквивалентен почти всему диапазону допустимых отклонений для подшипников меньше по диаметру. Чрезвычайно важную роль при исследовании играет контроль условий измерения.

Предполагая, что 100 мм стали подшипника увеличивается в размере на 1 мкм уже при нагревании на 1 °С, можно заметить, насколько важной является хотя бы сохранение постоянной температуры. Оборудование для изучения шума в различных масштабах позволяет оценить производство различных элементов подшипников. Устройства, контролирующее вибрацию для различных частот, позволяют обнаружить невидимые на первый взгляд повреждения, не снимая подшипника. Кроме того, измеряя шероховатость поверхности (например: Ra, Rz), можно получить полную информацию о состоянии подшипника. Измерение отклонений округлости и цилиндричности производится на машине Talugond 365 авторитетной компании Taylor Hobson. Это устройство позволяет на более быстрые и эффективные измерения с точностью, достигающей тысячной доли микрометра, то есть округлости, цилиндричности, концентричности, соосности, плоскостности и т.д. Быстрый анализ результатов измерений, а также их визуализация помогают обнаружить серьезные дефекты формы кольца, например трехгранность. Метрологические измерения являются лишь одним из видов контроля качества конечного продукта.

Рис. 16 Измерения производимые на устройстве Talugond 365

Вторым, не менее важным направлением является так называемый контроль качества поверхности. В этом случае поверхность детали контролируется на наличие трещин, царапин, «пригорелостей», вмятин, коррозии и состояния технического уплотнения. В большинстве случаев достаточен контроль невооруженным глазом, однако, в некоторых случаях дефекты могут быть обнаружены только при наблюдении под большим увеличением. С этой целью в лаборатории был установлен стереомикроскоп типа RZ японской компании ME-IJI. Кроме того, к микроскопу была подключена система передачи изображения на компьютер, включающая цифровую камеру марки DeltaPIX. Вышеописанное контрольное устройство позволяет проводить легкий и эффективный мониторинг поверхности тел качения и дорожки качения подшипников.

Рис. 17 Измерения производимые на устройстве Spectromax

Иным важным устройством, используемым во время проверки качества продукции CX®, является эмиссионный спектрометр SPECTROMAXx компании SPECTRO. SPECTROMAXx оснащен плазменным

цифровым искровым генератором, высокоэффективной оптической системой на основе ПЗС, где необязательно использование вакуумной среды. Проводимые на нем измерения основываются на возбуждении элементов, присутствующих в световом материале и анализе полученного спектра. С помощью этого устройства можно выполнять качественный анализ (какие элементы присутствуют в материале), и количественный анализ (количество данных элементов).

Богатый набор лабораторных приборов также включает устройства марки Bowers, Mitutoyo и Hommelwerke - ведущих производителей лабораторного оборудования в мире. Лаборатория располагает оборудованием для измерения уровня шума во время работы подшипников в трех различных частотных диапазонах и в двух масштабах. Как первая в Польше, лаборатория начала использовать устройство Vibnode компании Prüftechnik для диагностики подшипников. Использование анализа спектра вибрации позволяет оценить повреждения отдельных элементов подшипника. Для измерения точности главных размеров подшипников используются 3-х точечные нутромеры Bowers, пассаметры Bowers с различными диапазонами измерения, микрометрический датчик и измерительная плита Mitutoyo с КМД. Измерительные устройства выполняют автоматическую передачу данных на компьютер. Качество поверхности дорожки качения и элементов качения подшипников оценивается с помощью тестера шероховатости поверхности Hommelwerk. Измерение твердости элементов выполняется на стационарном тестере твердости по масштабу HRC.

Рис. 18 Установка автомобильных запчастей в машине

Наш многолетний опыт работы с компаниями, занимающимися автомобильной промышленностью, позволяет нам обеспечить высокое качество обслуживания. Благодаря современным средствам традиционной и электронной продажи, мы стараемся проводить сделки быстро и безопасно, и заботимся о том, чтобы клиент получил полную информацию о нашем предложении.

Наш опытный персонал ежедневно помогает выбрать лучшее предложение, которое соответствует с индивидуальными потребностями клиента. Мы систематически совершенствуем свои способности и расширяем знания, чтобы оказать Вам наши услуги на самом высоком уровне.

Работая в тесном сотрудничестве с нашими дистрибьюторами и партнерами, мы заботимся о том, чтобы наша продукция всегда была для Вас доступна.

Важное место в нашей концепции предоставления высококачественных услуг занимает логистический процесс. Современный склад высокого складирования, оснащенный современной компьютерной системой, вместе с квалифицированным персоналом обеспечивает своевременность и надежность поставок так, чтобы заказанные товары приходили к Вам в кратчайшие сроки и удобным для Вас способом.

Рис. 19 Логистический центр

Наша современная логистическая система обеспечивает оптимальный сервис для наших клиентов, в том числе благодаря:

- выгодному расположению на перекрестке автомагистрали A1 и A2, в самом центре Польши и Европы;
- складу высокого складирования, имеющему более 10 тысяч палетных мест ёмкостью в 8000 тонн;
- зоне на 23 подвижных стеллажа на 50 тыс. мест с общей вместимостью более 600 тонн;
- зоне полок потоков с вместимостью более 19 тыс. коробок с общим весом 500 тонн;
- системе интеллектуального конвейера длиной 1 км;

Наши сильные стороны:

- доступность продукции CX® в крупнейшем каталоге запчастей TecAlliance; соответствие стандартам Good Manufacturing Practice;
- сотрудничество с Европейской Ассоциацией Производителей Деталей Машин;
- контроль качества продукции, производимый в лаборатории Metrolog Sp. z o.o.

GOOD MANUFACTURING PRACTICE ★★★★★

3. ОСНОВНЫЕ ПРАВИЛА УСТАНОВКИ И ДЕМОНТАЖА РЕМОНТНЫХ КОМПЛЕКТОВ

3.1 Демонтаж ремонтного комплекта

1. Снимите защитный колпак гайки ступицы (1) и штифт (2). [Рис. 20]

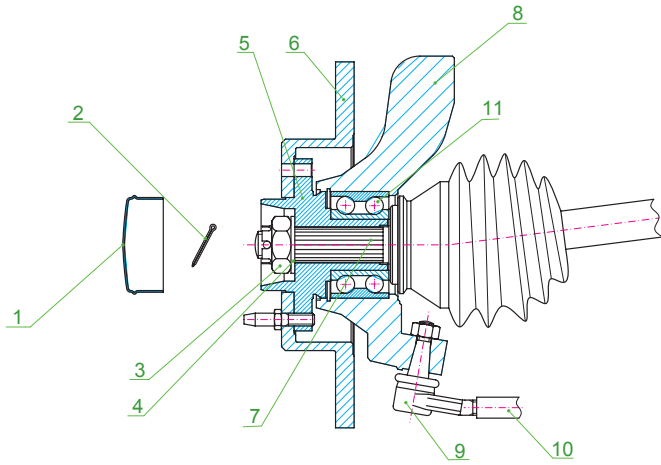

Рис. 20

2. Открутите гайку ступицы (3) и снимите шайбу (4). Заблокируйте вращение ступицы (5). [Рис. 21]

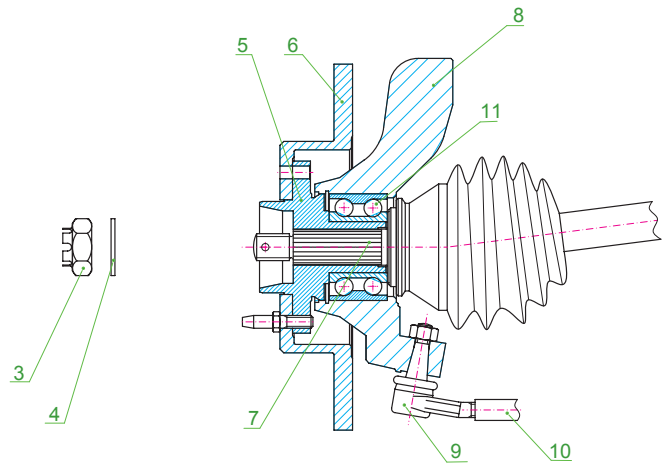

Рис. 21

3. Снимите суппорт с тормозного диска (6). [Рис. 23]

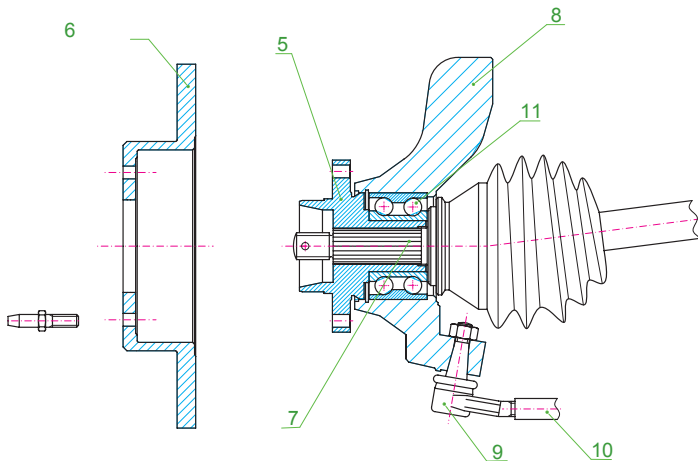

Рис. 22

4. Ослабьте ступицу (5) на шлице (7) – лучше всего молотком с мягким наконечником. Не снимайте. [Рис. 23]

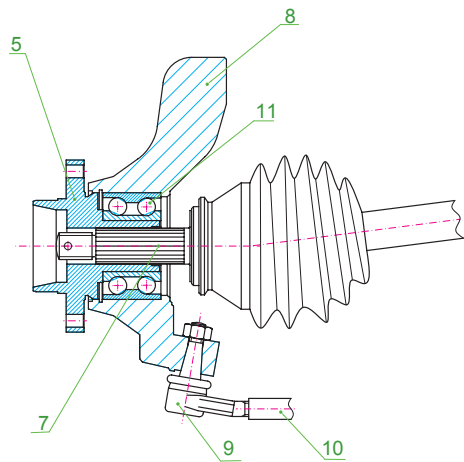

Рис. 23

5. В случае системы АБС, отсоедините и снимите датчик скорости колеса.

6. Ослабьте гайки и/или винты соединяющие шкворень (8) со стойкой подвески.

7. Отсоедините наконечник поперечной рулевой тяги (9) от плеча (10). [Рис. 24]

8. Снимите гайки и/или винты крепления шаровой опоры с нижним рычагом подвески.

9. Снимите шаровую опору со шкворня и подвесьте конец оси с помощью проволоки, вытолкнуть ось (7) из ступицы (5).

10. Снимите болты, соединяющие шкворень (8) со стойкой подвески и отсоедините шкворень от стойки.

11. Удалите шкворень (8) ступицу (5) и подшипник (11). Установите шкворень на прессе и удалите ступицу. [Рис. 25]

12. Осуществить демонтаж подшипника на прессе (11). [Рис. 26]

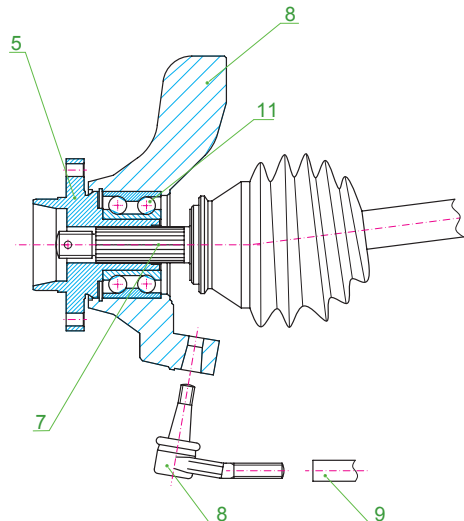

Рис. 24

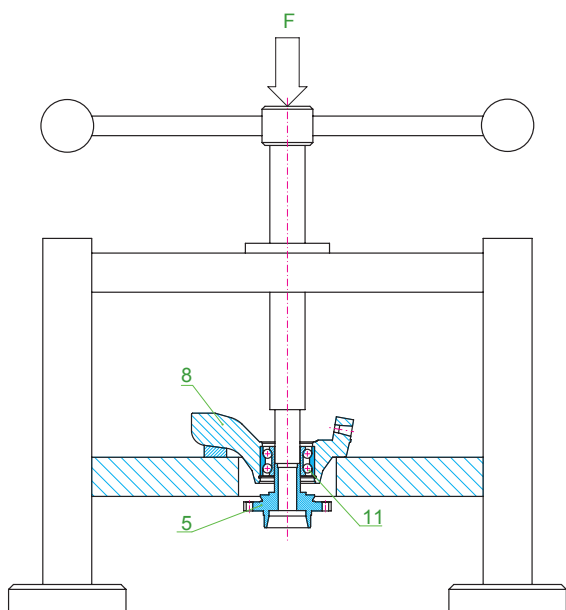

Рис. 25

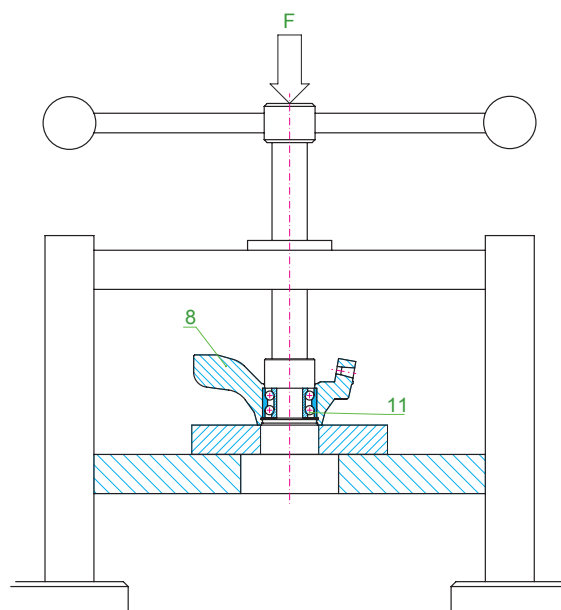

Рис. 26

3.2 Установка ремонтного комплекта ступицы колеса

13. Установите шкворень (8), ступицу (5) и подшипник (11) на свое место, продвигая ось в отверстие ступицы.
14. Протолкните шкворень к фланцу стойки подвески и закрутите гайки и/или винты, не затягивая.
15. Соедините стопорный болт со шкворнем (8) и закрутите.
16. Свободно соедините шаровую опору и реечный рулевой механизм (9) с плечом (10). После этого закрутите гайки стойки, стопорный болт с рычагом и гайку реечного рулевого механизма.
17. Поместите тормозной диск (6) на ступицу (5) и закрепите.
18. Закрутите гайку, соединяя ось со ступицей (2).

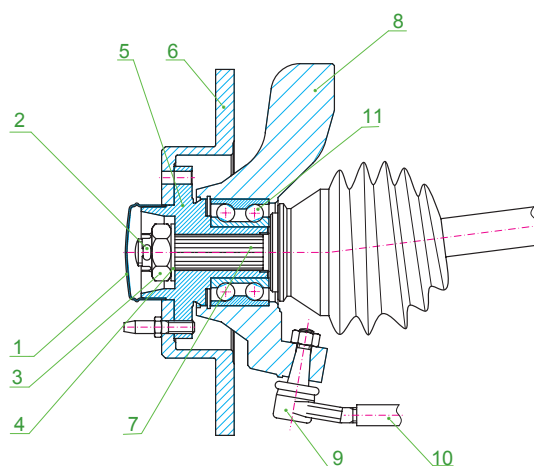

Рис.27

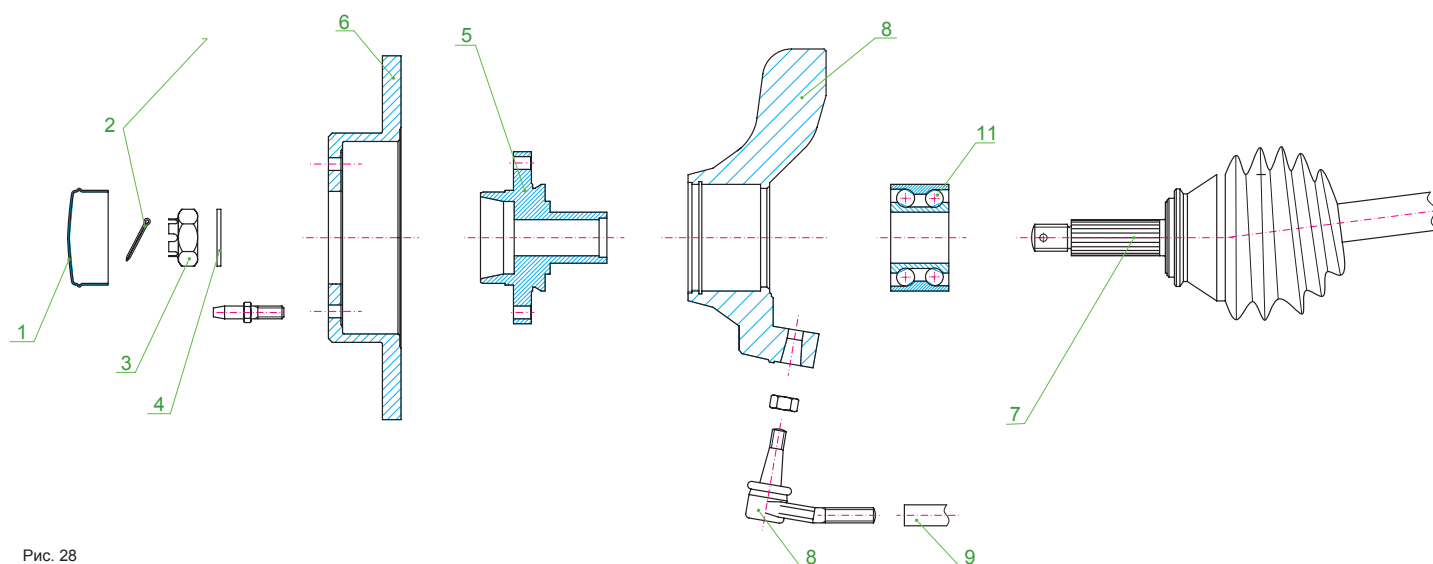

Рис. 28

4. ПОЛОМКИ ПОДШИПНИКОВ КАЧЕНИЯ И ИХ ПРИЧИНЫ

Выбор, установка и процесс смазки подшипников являются необходимыми действиями, влияющими на их правильную и длительную эксплуатацию. Температура правильно установленных и правильно смазанных подшипников не должна превышать 70 °С, и во время работы должна быть меньше.

Подшипник во время работы должен издавать регулярный шум низкого уровня (гул). Любого рода свист и скрип подшипников может указывать на очень малый рабочий зазор или недостаточность смазки. В свою очередь, дребезжание, прерывистый шум, грохот могут указывать на слишком большой люфт или повреждение дорожки и тел качения.

Повреждение подшипника может произойти в результате воздействия на него слишком большой нагрузки, неэффективного уплотнения или тесной установки, что приводит к появлению слишком малого люфта. Эти причины приводят к конкретному ущербу, оставляя специфический след в поврежденном подшипнике. Исследуя и проводя детальный анализ поврежденного подшипника можно сделать выводы относительно причин повреждений и принять предохранительные меры (рис. 29-30).

4.1 Причины выхода из строя подшипников:

4.1.1 Неправильная установка подшипника

Неправильно выполненную установку подшипника можно определить по царапинам, «затирианиям» и углублениям на дорожке качения подшипника. Причинами повреждения дорожки являются:

- перенос осевых сил во время монтажа, являющийся причиной вмятин на дорожках качения шариковых подшипников,
- смещение внутреннего кольца по отношению к наружному кольцу с роликами (смещение ролика по отношению к корпусу), что приводит к образованию «затирианий» на рабочих поверхностях цилиндрических подшипников,
- прямые попадания ударов молотка во время установки, что является причиной повреждения краев одного из колец подшипника.

AR1403

Рис. 31 Углубления и царапины на роликах могут возникнуть, когда внутреннее кольцо цилиндрического подшипника было криво вставлено во внешнее кольцо с роликами

Нетипичные следы работы дорожки качения могут быть вызваны слишком тесным размещением, чрезмерным продольным обжимом, деформацией штифта, смещением штифтов или слишком тесным креплением подшипника.

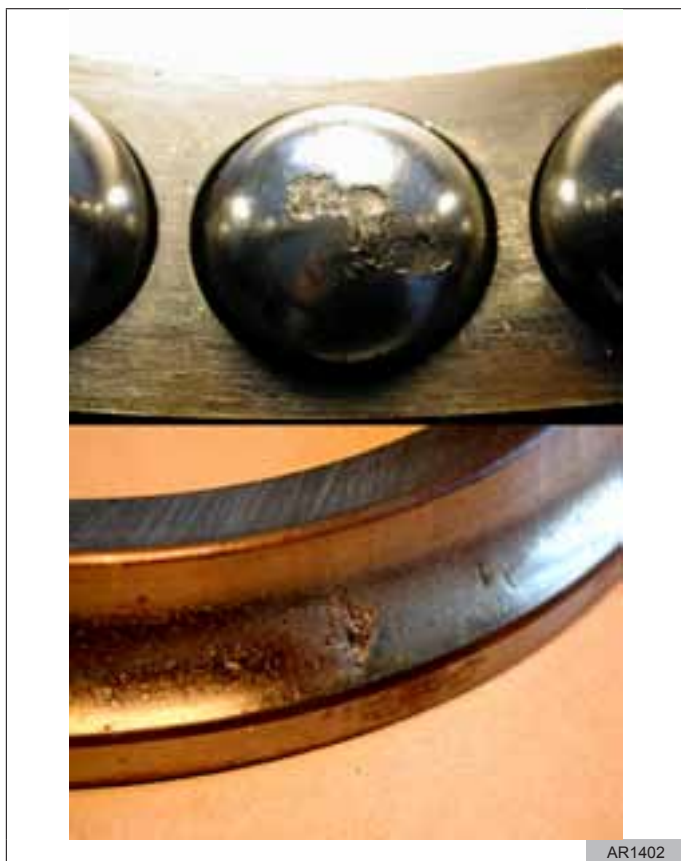

4.1.2 Ошибки проектирования

Большое значение имеет фиксация определенным образом кольца подшипника на вале и в корпусе. Если в месте насадки сделано углубление, это приводит к возникновению нагрузки в кольце подшипника, что во время работы может привести к повреждению дорожки качения. Фиксация кольца посредством докручивания винта на его окружности дает аналогичный эффект и может даже привести к появлению трещины на кольце подшипника.

AR1401

Рис. 29 Перегретые элементы роликового подшипника

AR1402

Рис. 30 Видимый износ материалов компонента подшипника

AR1404

Рис. 32 Перегрев подшипника из-за слишком плотного прилегания к корпусу

4.1.3 Коррозия

Повреждения подшипника в результате коррозии могут произойти из-за:

- неправильного хранения подшипников,
- неправильного уплотнения подшипника, что может привести к проникновению воды или других загрязнений.

AR1405

Рис. 33 Повреждение внешней дорожки качения подшипника из-за коррозии

4.1.4 Загрязнение

Загрязнение подшипника может быть результатом:

- установки загрязненных деталей,
- неправильной герметизации подшипников,
- загрязнения смазки.

4.1.5 Углубления на дорожках качения от элементов качения

В случае динамического воздействия элементы качения подшипника, находящегося в нерабочем состоянии, могут оставить отпечаток на его дорожках качения (рис. 34-35).

AR1406

Рис. 34 Углубления на дорожке внутреннего кольца подшипника образовавшиеся из-за передачи вибрации от работающего соседнего оборудования на вращающийся подшипник

AR1407

Рис. 35 Углубления на дорожках качения внутренних колец подшипников

Углубления на дорожках качения и элементах качения подшипника могут быть вызваны в результате потока электрического тока через подшипник (рис. 36).

AR1408

Рис. 36 Углубления на дорожке качения внутреннего кольца подшипника, возникшие в результате поступления электрического тока

4.2 Признаки серьёзных повреждений подшипников

4.2.1 Перегрев подшипника

Причинами повышенной температуры работы подшипника могут быть:

- слишком малый люфт подшипника,
- несоответствие смазки в данных условиях эксплуатации,
- слишком низкий уровень смазки в подшипнике,
- деформация корпуса, неровная поверхность опоры,
- дисбаланс вращающихся компонентов,
- неправильная центровка,
- повреждённая тормозная система, которая передаёт тепло на подшипниковый узел.

4.2.2 Шум при работе подшипника

Изменение характера и уровня шума подшипников может быть обусловлено следующими факторами:

- появлением загрязняющих веществ в корпусе подшипника (грязи, песка),
- проникновения в корпус подшипника веществ, ускоряющих коррозию напр. вода,
- недостаточным количеством смазки, например, в результате выбора неправильной смазки для данных рабочих условий подшипника
- деформацией корпуса подшипника,
- неровной поверхностью опоры,
- из-за слишком большого или слишком маленького отверстия в корпусе,
- дисбалансом вращающихся частей (колеса с шиной), вызывающим быстрое разрушение подшипника,
- уплотнением элементов качения из-за скольжения,
- вибрацией подшипников в нерабочее время (повреждением дорожки качения),
- деформацией герметизации подшипников,
- колебаниями, вызванными чрезмерным рабочим зазором,
- деформацией стопорного болта шкворня или других частей подшипника из-за перегрева,
- вращением наружного кольца в расширенном отверстии корпуса,
- деформацией дорожки качения подшипников (неправильной эксплуатацией автомобиля, например, несоблюдением нужной скорости при условиях неровности дороги),
- повреждение подшипника вследствие воздействия вызванного ездой по неровным дорогам с большой скоростью.

OGRANICZENIA ODPOWIEDZIALNOŚCI

Łożyska kół w wielkim stopniu odpowiadają za bezpieczeństwo czynne pojazdu, należy zatem bezwzględnie przestrzegać zaleceń, zarówno producenta łożysk, jak i zawartych w instrukcji naprawy pojazdu.

Niewłaściwy montaż może być przyczyną uszkodzenia auta, a także może doprowadzić do wypadku!

Jeśli nie masz doświadczenia w dokonywaniu napraw łożyskowań kół, zleć ich wykonanie wyspecjalizowanemu warsztatowi samochodowemu.

Podstawą do naprawy łożyskowania jest instrukcja naprawy wydana przez producenta samochodu.

LIMITATION OF LIABILITY

To a large extent wheel bearings are responsible for active vehicle safety, so both the wheel bearing manufacturer's recommendations and vehicle repair instructions should be strictly observed.

Incorrect installation may cause damage to the car and may even cause an accident!

If you have no experience in the repair of wheel bearings, order repair services at a specialised car workshop.

The basis for the repair of wheel bearings is the repair manual issued by the car's manufacturer.

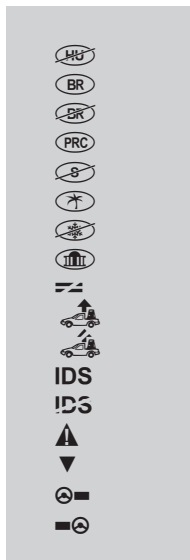

ОГРАНИЧЕНИЕ ОТВЕТСТВЕННОСТИ

Подшипники колес в значительной степени отвечают за безопасность автомобиля, поэтому следует строго соблюдать рекомендации производителя подшипников, а также инструкцию по ремонту транспортного средства.

Неправильная установка может привести к повреждению автомобиля,
и может привести к аварии!

Если у вас нет опыта в установке подшипника лучше поручить их замену станции технического обслуживания.

Основанием для ремонта подшипника служит инструкция издана производителем автомобиля.
